

SCIENCE IS THE PATH TO KNOWLEDGE, AND FINDING OUT ABOUT HOW OUR UNIVERSE WORKS. YOU CAN'T BE A GEEK AND NOT KNOW YOUR SCIENCE!

THIS MONTH IN SCIENCE:

From the ocean's movements to moving satellites to outer space with water, science promises to be a ride this month!

The Schrödinger Equation describes astrophysical disks

It is not very often that the equations describing the subatomic realm also describe large scale astronomical structures. In a surprising discovery, a researcher from The California Institute of Technology (Caltech) has found that the Schrödinger Equation accurately astrophysical disks around stars and supermassive black holes. <http://dgit.in/schrodinger-discs>

WHAT'S NEW

Intelligent aliens can be found by looking for their satellites

A researcher has proposed a new approach for identifying advanced civilisations elsewhere in the universe.

The method involves using powerful telescopes to identify rings of satellites around the home worlds of intelligent aliens. The approach is similar to conventional methods of identifying exoplanets by identifying dips in the brightness of the host star. The study shows how such rings of artificial satellites can be distinguished from normal planetary rings of dust, rock or ice. Red Dwarf stars have been identified as the most promising type of star on which to use the approach. Red Dwarf stars are also a good place

to hunt for exoplanets, and are a common type of star to host the planets most likely to harbour life.

While the approach could be used to find intelligent aliens, the study has implications for the security of humans as well. Because of our satellites, either we could find the little green men, or the little green men could find us.

NASA is allowing you to send your name to the Sun

NASA is giving away tickets to the Sun for free. If you are interested, you can add your name to the mission on the Parker Solar Probe website. The probe will fly into the corona of the Sun, in an effort to understand how solar activity affects the Earth and other planets. The studies conducted by the probe has implications for future deep space missions to the outer

Solar System. The atmosphere of the Sun affects all the planets, as it extends beyond their orbits. Those who send their names to the Sun will get a

ticket in the form of a certificate that they can download and print. The certificate is issued by NASA, and has the wordings "VIP Pass" on it. The deadline for submitting the names is 27 April, 2018. The names will be sent on the Parker Solar Probe on a microchip. Unfortunately, you will not be getting frequent flyer points for participating.

MIT researchers develop body on a chip

MIT researchers have engineered tissues from 10 organs of the human body, and connected them through a microfluidic medium in a box. The system accurately replicates the interactions of body organs for weeks at a time. <http://dgit.in/bdyonchp>

Tiny baby bird fossil sheds light on avian evolution

The fossil of a baby bird, the size of a cockroach has allowed researchers to better understand how birds evolved in the time of the dinosaurs. The bird died not soon after it was born, preserving fossilised details of a critical stage. <http://dgit.in/fslbrd>

The cyclones that rage on Jupiter are unlike anything else

The massive cyclones around the polar regions of the gas giant have features not seen anywhere else in the solar system. The findings were reported based on observations by the Juno spacecraft. <http://dgit.in/jnojptr>
