

Archos Citee Connect

French company Archos has been in the market with several different products over the years, from tablets to drones. Their latest product is also a stand out: the world's first Android-powered scooter. No, not like the Bajaj scooter that we're familiar with.

The Citee Connect, as the scooter is called, has a 5-inch display on it and has all the features you would expect of an Android smartphone. It's housed in weatherproof and shock-proof casing for obvious reasons.

The display sits between the handlebars and is powered by a quad-core processor. It features 1GB of RAM, 8GB storage, runs on Android Oreo and has 3G support. You can have Google maps running on the screen but Archos haven't fully disclosed everything you can do with its display. The scooter also comes with a companion app, like most things do these days, via which you can remotely lock the scooter.

The scooter itself is made of aluminium, has puncture-proof 8.5-inch wheels, a 250W motor and a 36W battery. It can support up to 100 kilograms in weight. The Citee Connect can reach speeds of up to 25 kmph and can recharge its own battery, effectively extending its life by 15 per cent according to Archos.

It's unlikely that we'll ever see one of these in action over here, but it's pretty cool nonetheless.

Fitbit Versa

A few years ago, smartwatch maker Pebble closed shop and Fitbit acquired most of it, including the IP and its engineers. The hope was that Fitbit would make the next Pebble. They took their time with it but the Fitbit Versa might just be what Pebble fans have been waiting for.

In terms of looks, the Versa already looks more like a Pebble than a Fitbit, which is a good thing. It's priced slightly less than the Apple Watch Series 1, which is the cheapest one available.

In terms of features, you've got all the things one would expect of a smart-

watch, so all-day heart rate monitoring, push notifications, and the app store are all present. However, they've ditched GPS support. Instead, they've promised four-plus days of battery life, hoping that the trade-off is worth it.

Other than that, the watch can store up to 300 songs on it, pair with your phone via Pandora, offer sleep tracking and more. Functionality depends on the plethora of apps available to you at this point. They've refined the OS as well, and Fitbit OS definitely seems like a step-up from the Pebble OS, which was also pretty decent on its own.

The Fitbit Versa might be worth keeping an eye on if you're a smartwatch enthusiast.

Ecobee Switch+

The Ecobee Switch+ is a light switch, but it also doubles as a motion and temperature sensor, and an Amazon Alexa speaker. It comes from the creators of Ecobee4, a smart thermostat. The Switch+ will be able to show you temperature for the room it's installed in. If you happen to have the Ecobee thermostat as well, you'll be able to control both devices with the same app.

The Switch+ also doubles as an Amazon Alexa Speaker. Meaning, you could potentially just get this instead of an Amazon Echo.

The fact that the Switch+ also doubles as an Amazon Alexa speaker is what makes it unique. While Alexa is compatible with many smart devices, there's very few devices that double as a speaker themselves. Of course, there are a few differences between using this and using an Echo Dot. For one thing, you'd need to get used to talking to a wall as opposed to a tiny speaker placed somewhere in the room. However, according to general sentiment on the internet, the Switch+ doesn't have too much trouble picking up commands from across the room. So it might actually be worth picking this up over an Amazon Echo.
