

Redbull ring edition S9, S9+

"Redbull Ring" edition Samsung Galaxy S9 and S9 Plus, named after the Formula One track, have been revealed. <https://dgit.in/redbulls9>

Android P Perfection?

Android P will be equipped to remember your volume settings for each Bluetooth device. <https://dgit.in/androidp>

Things to do after installing Windows 10

Here's an instruction manual that you should follow after you've formatted your PC

Abhijit Dey | abhijit@digit.in

Y

ou might have a myriad of reasons for a fresh install of Windows. However, after you've actually

installed Windows, there are a number of installations and tweaking you must go through for your desired settings. Hence, we've decided to come up with a brief but comprehensive guide of steps you should follow after installing your copy of Windows 10. Do note, that most of the following suggestions are applicable for older versions too.

GET FIREFOX

Fire up Microsoft Edge and download Firefox from the official Mozilla website, or maybe even Chrome. We aren't saying Edge is bad but Firefox and Chrome were comparatively way better. And among them, we found Firefox to be faster and lighter on your system's memory. After this mandatory step, you can move on to installing your motherboard drivers.

INSTALL HARDWARE DRIVERS AND WINDOWS UPDATES

Although Windows 10 takes care of installing basic drivers to run all your

hardware, you will still need to install motherboard specific drivers. This includes CPU chipset, GPU, Ethernet and Wi-Fi, audio, USB 3.0 drivers, etc. Additionally, you might have BIOS updates released by your motherboard manufacturer and even firmware updates. The most appropriate approach would be to find out your motherboard's model name and download all the drivers from the official website. If you can't find the model name of your motherboard, then you should download CPU-Z from <https://dgit.in/>

CPU-Z and go to mainboard to view the model. The driver downloads and optional utilities are usually listed in the support and download section of the product page. Now, you can move on to downloading your GPU drivers. Get them from the appropriate download pages of AMD, Intel or NVIDIA based on your GPU. Rather than manually doing these steps, there are applications out there that automate everything with a single click. Snappy Driver Installer (<https://dgit.in/SDITool>) is one of them that we would suggest.
