

GoPro TradeUp Programme

New TradeUp programme allows exchange of old digital cameras for a discount of \$50 on the GoPro H6 Black. <https://dgit.in/tradeup>

Honor 10 announced

The Honor 10 has been announced, powered by Kirin 970, 6GB of RAM, thin bezels and... a notch, due on May 15. <https://dgit.in/honor10>

After you're done with drivers, you should update Windows to the latest security patches and bug fixes. This might be a huge download and it will take a really long time to install. It's always best to download the basic patches and fixes before you start installing third-party software packages. Automatic download and installation of updates have become default now on Windows. Although you can keep postponing them, at one point they would simply enforce the installation.

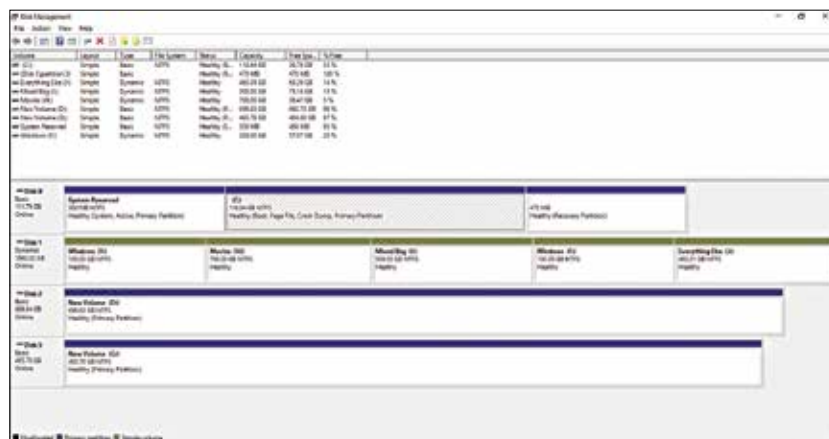

CREATE APPROPRIATE PARTITIONS

If you're installing a fresh copy of Windows 10, we would assume that your storage device is completely empty. Anyways, it's always best to create partitions in order to keep your files organised. Open up Partition Manager where you'll find all your storage devices listed. You'll see a single storage drive with a single partition per storage device that you're using. You can shrink the default volume and create a new volumes with the remaining space based on your requirements. Right-click on the storage device where you want to create volumes and select Shrink Volume. Here you can add the size of the new volume you want to create. Be careful with the math.

DISABLE TELEMETRY SERVICES

There are several tracking options on Windows enabled by default and not all are easy to find and disable. The Spybot Anti-Beacon (<https://dgit.in/SpybotAB>) tool automatically detects all the telemetry services running in the background. Apart from the mandatory ones, it also lists other Windows services that can be optionally blocked. However, under the optional services, blocking the OneDrive Service will affect the Windows Mail app.

In order to go all out on taking control of all your privacy and security options, you should download ShutUp10 (<https://dgit.in/ShutUp10>). Along with more settings, it also includes descriptions on what each aspect does and how turning it off will affect you.

Partitioning your storage space properly can go a long way

Ninite can save a lot of time and effort

INSTALL ESSENTIAL SOFTWARE

With all the basic settings and updates taken care of, it's time to download and install software for your daily usage. You can search for these software on websites like FileHippo or FossHub. It's a great way to discover new software as well. However, if you're of the one-click magic kind, you should take a look at Ninite. Rather than going through the download pages of every single software, Ninite (<https://ninite.com/>) allows you to pick all the essential software you need and generate a single installer file. With this installer, you can automatically download all the software that were selected. The best part is that the installer will always fetch the latest versions of the selected software.

MANAGE STARTUP PROGRAMS

You can view startup programs by opening Task Manager and going to the Startup tab. Depending on whether

you want any of them to startup on a system boot, you can disable some of them to save boot time.

REMOVE WINDOWS BLOATWARE

You can uninstall most of Windows bloatware only through the Windows Powershell. You can individually uninstall the apps with the command: `get-appxpackage <package name> | remove-appxpackage`. For example, if you want to remove the Calculator app, you should enter the following: `get-appxpackage *calculator* | remove-appxpackage`. To remove all built-in apps from Microsoft, enter the following command: `get-appxpackage -allusers | remove-appxpackage`. To roll that back, you should re-install all the packages using the following: `Get-AppxPackage -allusers | foreach {Add-AppxPackage -register "$($_.InstallLocation)\appxmanifest.xml" -DisableDevelopmentMode}`
