

Late Shift comes to Switch

It is the latest device to get the Wales Interactive choose-your-own-adventure game, Late Shift. <https://digit.in/lateshift>

100 million+ Amazon Prime users

Jeff Bezos has finally shared that Amazon Prime currently has over a 100 million users. <https://digit.in/amaznprim>

AMD Ryzen 5 2600X

Team RED brings it up a notch

The Ryzen 7 2700X has certainly given the 8700K a run for its money, so is the Ryzen 5 2600X set to do the same with the 8600K? For Cinebench, both CPUs only differ by 2-3 points in the 1T run showing that the AMD CPU has closed the gap completely. However, the 2600X is multithreaded while the 8600K isn't and in the Cinebench 15 nT run, we see the 2600X taking a lead of around 360 points. And it's not just rendering tasks. Even in synthetic encoding tasks such as 7-zip compression, the 2600X maintains a 20% lead over its competitor. Even the cache latency of the CPU has been reduced with the second generation of Ryzen CPUs bringing

them on par with the Intel CPUs. Gaming was one of the pain points of the first generation Ryzen CPUs and thanks to the improvement in cache latency and other optimisations, that drawback has been negated. Now, the 2600X performs just as well as the 8600K in titles such as Rise of the

Tomb Raider and Middle Earth: Shadow of War. Titles such as DotA 2 and Overwatch still do better on Intel CPUs as these competitive titles are highly optimised. Hopefully, upcoming patches should bring the same level of optimisation for the new 2nd gen Ryzen CPUs as well. Unlike the 2700X, the 2600X is actually retails for a lower price than the 8600K in India. So if you consider that you get way better multi-threaded performance and just about the same single-threaded performance as the 8600K as well as a cooler thrown in the mix, the Ryzen 5 2600X ends up being the better deal.

—Mithun Mohandas

SPECIFICATIONS

CORES: 6 | THREADS: 12 | BASE CLOCK: 3.6 GHz | BOOST CLOCK: 4.2 GHz | PROCESS NODE: 12nm | L3 CACHE: 16 MB | L2 CACHE: 512 KB per core | TDP: 95 W.

Logitech G433

A fashionable gaming headset

Not everyone will be happy to experience the Logitech G433's scratchy fabric material on the earpads. While using them, the fabric created some noise when it would brush against our hair or skin which got annoying sometimes. However, this is where the extra set of microfiber-layered earpads come in to the rescue.

The headset is lightweight and scapable of not fatiguing your ears or head even after a few hours of gaming. The earcups swivel 90 degrees flat so that you can comfortably place them around your neck when you're not using them.

Audio performance on the G433 was impressive and close to a more

neutral sound signature. It was pretty close to the HyperX Cloud Revolver S but it lacked the right amount of bass. This means that gunshots and explosions won't sound as punchy as they did on the Revolver S or the ASUS Cerberus V2.

You can still pinpoint sounds coming from all over the place and distinguish

voice chat from gunshots. The G433 is capable of simulating 7.1 surround (not the best out there) sound using the USB DAC module.

We prefer the approach of providing a shorter splitter cable for PC connectivity since it ends up saving a lot of unnecessary cable clutter. The detachable microphone could have been a little more flexible. We had no problems with the mic performance and our voice sounded close to a flat signature. Although we wouldn't recommend it for voiceovers or live streaming.

There's modularity to the gaming headset and it certainly can be your next, considering all the caveats you get for the price.

—Abhijit Dey
