ASUS ROG STRIX X470-F GAMING

For the second coming of Ryzen

If the Crosshair VII is out of your budget then the STRIX X470-F GAMING is the second best motherboard from ASUS for the new AMD Ryzen 2 CPUs. The two boards are fairly similar with the X470-F sporting an x2 PCIe M.2 port as compared to the x4 M.2 slot on the Crosshair VII. Also the Type-C port on the X470-F GAMING is USB 3.1 Gen1 and there's no Wi-Fi/Bluetooth module. Aside from these, the key difference lies in the VRM circuitry and the Crosshair is clearly superior in that aspect. There's a reason why a lot of overclockers prefer the ASUS Crosshair or Maximus line of motherboards. The overall aesthetics of the X470-F Gaming is very clean and

the RGB isn't excessive. However, you do have RGB headers to set up a mini disco within the cabinet if that's 'how you roll'. One of the M.2 slots is hidden underneath a heatsink. We say hidden because the heatsink melds

seamlessly with the overall design. There's a plastic shroud over the I/O section with an RGB slit + ROG logo on it. It's a nice touch but putting in the CPU power connector later becomes a teensy bit difficult since you can't squeeze your finger in the space between the shroud and the connector. The board is missing onboard power/reset switches so all you open-cabinet warriors might be a bit miffed. Overall, this is yet another excellent board from ASUS for AMD CPUs.

—Mithun Mohandas

iBall CompBook Premio v2.0

The luxury of Windows 10 on a budget

Like most laptops in the budget segment, the iBall CompBook Premio v2.0 comes with a plastic build. This time around, iBall have gone with a dark grey colour, which actually looks pretty nice. In terms of feel, the keys feel alright, there's decent travel on them and the feedback isn't too bad. However, as you get closer to the middle and bottom, the chassis tends to start flexing.

The Premio v2.0 features an Intel Dual Band Wireless-AD 3165 for WiFi, Bluetooth 4.0, a mini HDMI port, 2 USB 2.0 ports, a single USB 3.0 port and even a 10/100M LAN port, which is a nice addition.

There are no fans or vents on the Premio v2.0 because the Intel Apollo Lake N4200 CPU, with the accompanying Intel HD 505 GPU, doesn't need active cooling. It's a slight upgrade over the recent Celeron and Atom processors.

The laptop comes with an in-built storage of just 32GB. Thankfully, it's expandable via 2.5-inch hard

drives or SSDs. In our PCMark battery benchmark, the laptop lasted for almost 4 hours. However, during our casual use of the Premio v2.0 we didn't need to charge it for an entire day.

The Premio v2.0 is a step up in the budget laptop segment, and offers decent features for its price point. Just don't expect outstanding specs or build. While most competing laptops ship with Ubuntu, the iBall Premio v2.0 gives you the luxury of Windows 10 at the cost of storage.

—Manish Rajesh
