

Google trains AI

Researchers at Google are developing a deep learning AI model that can recognise individual voices in a video. <https://digit.in/aivoice>

Lost in Space game on Google Home

Netflix launches a game mimicing an "escape the room" game, playable on Google Home, to promote its recent show: Lost in Space <https://digit.in/googlehome>

Teardown: HTC Vive Pro

Taking VR to the next level

Abhijit Dey | abhijit@digit.in

Higher resolution display

The Vive Pro uses two 1440p Samsung AMOLED panels with a combined resolution of 2880 x 1600 and a 90Hz refresh rate. They follow the same Fresnel design seen on the original Vive.

Visible light filters

Beneath the front cover, you'll find IR-friendly windows to filter out the visible light incident on the headset. This allows the headset to easily spot all the IR beams emitting from the Lighthouse base stations.

Photodiodes assemble

There are a total of 32 photodiodes under the front cover. These photodiodes are used to detect the IR beams coming from the Lighthouse base stations to trace the movement of the headset.
