

Steal or No Deal?

With a sizeable drop from the original price of 699\$ to 399\$, the formerly lacklustre Essential phone has made up some ground. <https://dgit.in/essenph>

AR cancer-detecting microscope

Google has developed a prototype of an AR powered microscope that can detect cancer in real time. <https://dgit.in/arcancer>

The brains

All the signals from the IR sensor arrays, cameras and microphones are taken care of by the mainboard right under the front cover. You'll also find a copper slab beneath the mainboard to ensure the components are shielded and cooled at the same time.

HTC
Vive Pro

Chaperone system

Valve's Chaperone system tracks the user's position relative to physical walls around them. It creates a virtual grid inside to notify the user if they are too close to the wall. This system is possible using the two cameras at the front that also help in basic hand tracking.

More sensors

Just like the headset, the controllers also come packed with sensors. The position of the controllers is tracked using the 24 sensors inside by the Lighthouse base stations. Similar IR-friendly windows are also found on the cover.
