

CLOVR

Funding: \$3,395 pledged of \$3,814 goal

Link: <https://dgit.in/CloVR>

CLOVR is a mobile app that lets you transform supposedly any PC game into a virtual reality experience. Mind you, this is not a VR headset, but a mobile app. You're going to need a mobile supported VR headset in order to use the app.

What CLOVR does is take the game you're seeing on your PC and convert into a VR-ready format that streams to your phone. As long as your PC is capable of running the game, it should work just fine on CLOVR. The image is transmitted to your phone over WiFi.

CLOVR supports all PC games. Of course, playing a first-person game would be ideal for the most immersion, but that doesn't mean that other games will not work. They've compiled a list of games they tested with CLOVR on their campaign page, the link to which we've provided above.

CLOVR is completely wireless, so if you're got a controller or a wireless keyboard/mouse setup, you can get nice and comfy for a session of wireless gaming.

CLOVR can also utilise the phone's inbuilt gyroscope to allow for seamless headtracking. So you will actually be able to look around while using CLOVR and not just stare at the screen passively. The best part is CLOVR lets you experience VR at a much cheaper price point. Check them out on Kickstarter.

NATEDE

Funding: \$82,688 pledged of \$61,914 goal

Link: <https://dgit.in/NATEDE>

The NATEDE is a smart air purifier designed to reduce indoor pollution and analyse it. It's been designed to look good and looks right at home in modern houses and offices. On the surface, NATEDE looks like a very fancy flower pot. NATEDE uses a photocatalytic filter to purify the air, which doesn't require any replacement or maintenance. The filter converts water in the air into a form that turns molecules of pollution into more harmless substances. Additionally, there's a plant in there too, which helps with the process. The creator, Clair, claims that NATEDE is capable of successfully eliminating 93 percent of VOCs (Volatile Organic Compounds), and 99 percent of bacteria, viruses, fine particulate and odors.

As with everything these days, NATEDE comes with its own dedicated app, which allows users to monitor everything in real time. It also has IoT and smart sensors so it works in tandem with other smart home devices. Check the fancy flower pot out on Kickstarter at the link above.

Street Fighter: The Miniatures Game

Funding: \$1,029,449 pledged of \$400,000 goal

Link: <https://dgit.in/SFMini>

When you think Street Fighter the first that pops into your head normally isn't a tabletop game, it's the complete opposite of that for that matter. It's a fast-paced arcade game for crying out loud, how do you transition that into a tabletop game? Street Fighter: The Miniatures Game claims to have managed this and features grid-based stages with destructible environment, several game modes, and a turn and deck-based combat system.

How the game works is every player draws two cards from their respective fighter's battle deck and can move around

the board during this phase. After this, each player has two extra actions, they can choose to move again, or draw a card, or play cards they have. Whether or not your action works depends on the dice roll.

On the defender's side of things, you can choose to simply block, or counter-attack, depending on your dice roll. There's also a gauge that builds up as you play which lets you enhance attacks and use

combos. So yea, it's basically Street Fighter turned into a board game.

It's not cheap though, the base game, which comes with 8 fighters (including figurines and battle decks) costs \$80. At \$140, you get any fighters that have been unlocked via the campaign's stretch goals, which as of right now is 3: Guile, Blanka and E. Honda. There are nine more planned. If you're willing to dish out \$280, you'll have all the above and four expansion packs, each with four additional characters.

Note that the miniature figurines used in the game are really well-made and definitely of worth to collectors. They've deliberately been made in sizes larger than usual. So even if you don't play the game itself, the figurines can be put on display.
