

PUBG went down to Bottle Flip

PUBG Mobile lost its number one position on the US Google Play apps chart to Impossible Bottle Flip. <https://digit.in/impossibleflip>

Perfect Minesweeper AI

Programmer claims that he has created the perfect Minesweeper player which relies on some luck initially. <https://digit.in/perfectai>

GEAR

All troopers were equipped with a utility belt that contained additional magazines and survival equipment. The Clone troopers also had a grappling hook housed within the utility belt. While the Clone troopers were equipped with DC-15 Blasters, the Shocktroopers were equipped with DC-15 rifles. The rifles had a sniper scope that doubled as a grip. These were both plasma based weapons that used electromagnets to accelerate small amounts of gas. The plasma rifles ionized tibanna gas stored in cartridges. Each cartridge could provide up to 500 rounds. Imperial era

primary weapon. The sidearm was a Sonn-Blas SE-44C, with a vibrating grip to alert the trooper of low ammunition. The scoped rifle issued to First Order stormtroopers was the Sonn-Blas F11D. The flametroopers were issued with a D-C93 Incinerator, which had back mounted propellant tanks, and D-93w flame projector gun.

VEHICLES

The Clone Troopers used a variety of speeders towards the end of the Clone Wars. The Swamp Speeders could seat two, was equipped with a turbofan engine on the back, laser scanners beneath the chassis and blasters in the

equipped with six laser cannon turrets along the sides, and a mass driver cannon on top.

Troopers had a number of walkers in the Imperial Era. The most famous ones are the All Terrain Armored Transport (AT-AT) walker and the All Terrain Scout Transport (AT-ST) walker. The AT-AT walkers were large, dominating presence on battlefields. They were supported by the smaller AT-ST walkers. The First Order used an upgraded version of the AT-AT walker known as the All Terrain MegaCaliber Six (AT-M6) walker, which had gorilla like forelegs.

For transport and deployment purposes, the Clones used Republic gunships. These could house up to 30 troopers at a time. The AT-TE walkers could be mounted under a Republic gunship for battlefield deployment.

In the Imperial era, troopers were deployed using two types of shuttles. The Lambda-class T-4a shuttle had the iconic tri-wing design, and could ferry up to 20 troopers at a time. The larger Sentinel class shuttle could carry a staggering 75 troopers at a time.

The First Order troopers used the Troop Transporter that ferried 20 troopers at a time. These two squads would line up to the left and right side of the ship. A disembarkation ramp allowed them to disembark one at a time. Spotlights in the front could be strategically used to blind enemies, and provide adequate lighting to the troopers on deployment.

Clone pilots flew the Aggressive Reconnaissance-170 starfighter or ARC-170 starfighters, which would be later replaced by the TIE Fighters. In the Imperial era, there were a number of TIE fighters equipped for special missions such as interceptions, defence and bombing runs. The main model was the TIE Interceptor, which is known as the TIE/in. The First Order TIE Fighters were based on the Imperial TIE Interceptors, but had additional capabilities for defensive purposes. The models were known as TIE/fo Fighters, with the letters standing for "First Order". 

The standard issue trooper weapons

stormtroopers used a short range combat pistol. The Imperial stormtroopers used the E-11 BlasTech blaster, which had a similar mechanism to the DC-15 blasters. Even the blasters were equipped with a permanent scope on top. The Imperial stormtroopers used the BlasTech DLT 20A Laser Rifle.

The utility belts of Imperial stormtroopers had the usual survival supplies and grappling hooks that the Clone troopers were equipped with. Additionally, they also had a comlink and a thermal detonator. The backpacks could be equipped with life support systems, mortar launchers, communication equipment and gear for establishing a security perimeter.

The First Order stormtroopers used the Megablasters or the Sonn-Blas FWMB-10 repeating blaster as their

front. The more streamlined BARC speeder had a repulsorlift engine.

In the Imperial era, the speeder bikes was the ubiquitous transport of the scout troopers. These bikes were highly maneuverable even at extreme speeds. The repulsor drive was located at the back, while vanes on the front provided a guided repulsor field. A sensor at the top of the vehicle was used for scanning the terrain ahead.

Clone Troopers also used the AT-RT walkers, or the All Terrain Recon Transport. They were smaller than the well known AT-ST walkers from the Imperial period, with an open cockpit and a front facing repeating blaster. The Pod walker had three feet, a laser canon as well as a blaster cannon. The All Terrain Tactical Enforcer was a walking tank with six legs. It was
