

COD to take on Battle Royale mode

COD will take on PUBG and Fortnite's Battle Royale Mode by adding a multiplayer mode to Black Ops 4. <https://digit.in/codbattlroyal>

Westworld creators shift to Amazon

Westworld creators made the shift to Amazon for their newest production adapted from 2014 sci-fi novel The Peripheral. <https://digit.in/westworld>

Breaking The Sound Barrier

Sound engineers are magicians that work behind the scenes and ensure that you hear and remember that lovely song or have a fantastic experience at a live concert. While unknown, they are the backbone of the entertainment industry.

E

ver seen an audio console up close? The sheer number of knobs and buttons they adorn strike fear

into the hearts of most musicians or technicians who have never worked with one. A sound engineer is in charge of ensuring that a sound performance goes smoothly. All technical as well as mechanical aspects of sound fall under the sound engineer's hat.

The terms sound engineer and music producer are often used as synonyms, when in reality the two are as different as chalk and cheese.

Generally associated with music, the term sound engineers encompasses many more industries. Their presence is integral in designing and executing conferences, sports matches, theaters, live music concerts, computer games, as well as, the more obvious, film, television and radio shows.

THE DIFFERENT TYPES OF SOUND ENGINEERS

Sound engineers are usually identified as long-haired dudes standing at the massive console in a concert, mixing the sounds that get carried out to the audience. Is this guy, who makes what the industry calls 'front of house' sounds, the same as the guy who handles the monitors on the stage?

IF YOU'RE STILL WONDERING WHAT A MONITOR IS, READ ON.

Monitor Engineer:

The gigantic speakers facing musicians on a stage are monitors. It's the monitor engineer's job to ensure the musicians can hear themselves while they're performing, to make necessary pitch and pace alterations live in concert.

Live Sound Engineers:

A live event needs one or more of these to ensure that the sound reaching the audiences is that of high quality and utmost clarity.

Systems Engineers:

These outdoorsy folk help setting up the rather complex PA systems that assist other sound engineers do what they do! Managing the monitor engineers as well as the live sound engineers, they are the ringmasters behind the whole act.

Wireless Microphone Engineers:

It is the job of these engineers to ensure that all wireless microphones are working without a hitch, especially at live events.

Studio Sound Engineers:

They work in a studio on recorded pieces and are responsible for churning out high quality recordings of music, sounds or any other special effects as demanded by the client.

Mix Engineer:

As the name suggests, a mix engineer does just that - he/she mixes tracks and creates a brand new track.

Mastering Engineer:

The master of the mixer, their task is no cakewalk. The smoothen the track provided by the mix engineer, giving you the final product.

R&D Audio Engineers:

Their sole responsibility is conducting research and development on new and exciting techniques and innovations in the field of sound engineering.
