

Robot assembles Ikea furniture

Researchers in Singapore trained robots to assemble Ikea furniture, who complete the task in about 20 minutes. <https://dgit.in/robitikea>

Search for another Earth

NASA and SpaceX team up to find exoplanets that can host life by launching TESS, a planet-searching spacecraft. <https://dgit.in/tess>

Military

What: A 3-day crash diet to lose a lot of weight.

Details: This diet was supposedly followed by men in the armed forces who needed to lose a lot of weight quickly for an upcoming health checkup.

How you can go about it: This diet comes with a proper diet plan for its entire duration. You can check it out here: <https://dgit.in/military>.

Pros:

- Essentially a low calorie diet that involves no snacks.
- Meal plan to include fresh vegetables and fruits.
- No supplements, no complicated ingredients.

Cons:

- Mostly losing water and some muscle, rather than fat.
- Lost weight returns.
- Has been denied by the armed forces.
- No proof that the food combination increases metabolism.

Keto

What: A low-carbohydrate diet that puts the body in a state of ketosis, which means that the body starts converting dietary fat and body fat into ketone bodies used to fuel parts of the body that do not oxidize fat for energy, especially the brain.

Details: Also known as low-carb or no-carb diet, keto reduces the consumption of the energy providing carbohydrates in your diet. This diet forces the liver to produce ketones for energy. This diet is based on your body's ability to break down fats for energy, which is not a normal occurrence as the energy requirement is satisfied by the glucose found in carbohydrates, leading to fat being stored away. Should not be confused this with a general reduction of calories in your diet.

How to go about it: This one's pretty simple - drop all carbohydrates from your diet and fill it with fats. So, things like grains, sugar, fruit, and tubers are out whereas meats, leafy

greens, above ground vegetables, high fat dairy, nuts and seeds, sweeteners and other fats are fine.

Pros:

- Keto has been proven to work (<https://dgit.in/ketodiet>).
- It doesn't reduce your overall food/calorie intake.

Cons:

- Common side effects include
 - Cramps
 - Constipation
 - Heart palpitation
 - Reduced physical performance
- Keto Flu: A temporary ailment that most new ketoers experience that involves slight discomfort including fatigue, headache, nausea, cramps, etc.
- Ketoacidosis: Due to low insulin level, especially among diabetics, and over-production of ketones, this phenomenon can cause symptoms like vomiting, abdominal pain, dehydration, drowsiness, and more.

DASH

What: Eating what keeps your blood pressure low

Details: The DASH (Dietary Approaches to Stop Hypertension) diet was developed with the objective of keeping your blood pressure low and your heart healthy. It emphasises on foods rich in protein, fiber, potassium, magnesium and calcium and low in saturated fat, sugar and salt. A growing list of proof indicates that DASH is also helpful for managing diabetes, preventing cancer and improving kidney health.

How you can go about it: Structurally it is pretty similar to Paleo diet, with the exception that it allows grains.

Even for meats, you need to stick to lean stuff as red meat pushes your BP higher. Alcohol is a big no.

Pros:

- Additional benefits indicate helpfulness for diabetics.
- Recommended by the American Heart Association and the National Heart, Lung, and Blood Institute.

Cons:

- It can be arduous to constantly evaluate what is healthy for your heart and what's not.
- This diet is known to vilify the practice of eating out and completely restricts it.

SPECIAL NOTE: MIND DIET

This one's a diet designed to slow down dementia and alzheimer's as you age. MIND stands for Mediterranean-DASH Intervention for Neurodegenerative Delay. It is a combination of the DASH diet with another dietary regime, the Mediterranean diet, to create a dietary pattern that focuses on brain health.

For instance, MIND diet encourages its followers to consume more berries, which have been shown to improve brain functions. Other food items included in it are olive oil, nuts, whole grains, fish, poultry and even wine. You'll need to avoid butter, cheese, red meat, fried food and any kind of pastries and sweets too.
