Quin Helmet

The Quin Helmet is a smart helmet by Quintessential Design. A helmet, which according to them, “thinks about your safety” for you, so you can stay focused on your ride. Quin helmets focus on three main aspects – Bluetooth integration, which allows for using of maps, handsfree calls, music streaming and using of assistants like Google Assistant and Siri. Second is the IntelliQuin Crash Detection System: IntelliQuin technology can allegedly accurately detect the levels of crash force the rider experiences in the event of a crash and can immediately reach out to emergency contacts and inform them of their specific location. The third and final aspect is the IntelliQuin SOS beacon protocol. This beacon actually lets users of the Quin helmet manually reach out to other riders using the helmet in case of any emergency.

In addition to integrating all of the above into their helmet, Quintessential Design have also created a range of helmet models with various design options that incorporate these features. They’ve taken into account the various types of riders and the various riding cultures when creating their helmet. Also, the helmets are quite light, weighing in at just 1.270Kgs.

Wanle iPhone Case

Called the Wanle Gamers Console for iPhone, the case is designed for iPhones 6 and above. The one thing that is noticeable right away when you look at the case is that it looks similar to a Classic Game Boy. You’ve got all the familiar buttons including the D-pad, the A and B buttons, the power and reset buttons, and finally buttons to make selections and turn the audio on and off. Oh, and of course, a square-monochrome LCD display. Keep in the mind that all of these features are on the case, hence they are behind the iPhone when they are in use. It comes equipped with a few classic games, such as Tetris, Tank, and Frogger to name a few. Think of this innovative case as a Game Boy emulator of sorts. Now one thing to point out is that there are already many apps that allow you to emulate the Game Boy on your phone itself, an example being MyBoy which is available on the App Store as well as the Play Store. So the only reason you would probably want to get this case is for nostalgic purposes. Also, we’re not sure of its protective capabilities as a phone case. We can foresee it will probably get stuck in pockets because of the protruding buttons.

Levi Commuter

The Levi Commuter Trucker Jacket with Jacquard by Google is quite a mouthful, and quite the collaboration. The name refers to a research project called Jacquard, which is named after a fabric made on a loom that was started in Google’s Advanced Technology and Projects division.

What’s special about the Levi Commuter is that it can connect wirelessly with your iOS or Android phone and allows you to use gesture-based controls and haptic feedback to perform smartphone functions. While the capabilities are quite limited at the moment, the jacket can still perform plenty of basic functions like navigation and music control.

The jacket’s left cuff is woven using a conductive fibre and a special-grade polyester. This actually allows the cuff to work as a touch sensor. The rest of the jacket is made with Levi’s traditional denim, but the difference between the materials is supposedly very hard to notice.

The Jacquard tag is snapped into place on the cuff, and it’s not exactly a subtle tag but it houses a lot of the components such as the haptic monitor, the Bluetooth, the battery and the motion sensor. Once you’ve paired it with your smartphone via the app, you can start using cuff touch gestures to control actions on your smartphone. The tag has a battery, so naturally

it will need to be charged. It can be plugged into a USB-A port and takes about an hour to fully charge, and can supposedly last up to two weeks without needing to be charged. Even more if you don’t use it frequently as it can detect when the jacket is not in use and powers itself down.
