

Blea Electric Surfboard

We're not really much for surfing in India, are we? Doesn't mean we can't indulge though, does it? The Blea Shark is a surfboard, well, an e-surfboard to be exact, that's aimed at helping people learn and pick up surfing.

The Blea e-surfboard lets you surf anywhere. Well, not literally anywhere, but any body of water, be it your local pond or a swimming pool. It doesn't need the weather to be "just-right" or the perfect wave.

From what we've heard, surfing isn't an easy thing to pick up, but the creators of Blea say that there's no learning curve to using the Blea. It'll take you as little as five minutes to supposedly "master the ocean" with the Blea e-surfboard.

In case you're still wondering, with this e-surfboard you need only stand on it to get started. The board pretty much does the rest.

The Blea has a top speed of 48 km/h and a battery life of 1.5 hours. The batteries are swappable. Additionally, it's supposedly not very heavy at roughly 30Kgs, which is great. It would be a hassle lugging it around otherwise.

Sega MegaDrive Mini

Just announced in Japan, commemorating the system's 30th anniversary, the Sega MegaDrive is making a comeback as the MegaDrive Mini. An FYI for those who might not be aware, the Sega MegaDrive was the original name for the Sega Genesis, which is what it was sold as in North America. Well, it's

not like we'd know either way, our country was not one that had a gaming culture back then. Anyway, like the NES and SNES made a comeback with their respective mini classic versions, Sega decided they would do the same with the MegaDrive Mini. This is great because it gives those of us who missed out back then, a chance to relive the classics.

However, Sega stated that the name "MegaDrive Mini" is tentative and could change. Also, the MegaDrive Mini is set to go on sale sometime this year, however, for now, it'll be Japan only. But, there might be a worldwide launch for the Genesis Mini.

EverCam

The EverCam is a security camera that features face-recognition and motion detection. It is capable of recording in 1080p full HD, comes equipped with night vision, is weatherproof, and lastly, is completely wirefree. To top it off, the EverCam also supposedly features an obnoxiously unbelievable battery life of around 365 days.

The thing that stood out most is the fact that it was completely wirefree. There are no power cables or wall outlets needed. You won't need to drill holes or do anything in order to install the EverCam, you can mount it on to just about any flat surface, making it highly convenient.

Using the accompanying app, EverCam gives users the option to determine

how and when they receive notifications. Users can set a security level preference and the cam will alert you accordingly, from when it detects movements to when it doesn't recognise a face that shows up in front of it.

The EverCam features a wide-angle lens that provides a 140 degree panoramic view and uses a Sony Exmor sensor combined with an aperture of f2.2. Additionally, footage is stored locally, there's no additional cloud storage fees on the users part. There's also no cost for setting up or installing the device. However, there is still an option for cloud storage.
