

Forest of Liars

Funding: US\$ 38,984 pledged of US\$ 105,861 goal

Campaign link: <https://dgit.in/FoL>

Forest of Liars is a narrative adventure game and the first game by Umeshu Lovers Studio comprised of a group of veterans from the gaming industry. We know of at least one person from the studio who has previously worked for many game and movie studios including Rocksteady, Ubisoft, and DreamWorks.

One look at the game's trailer and artwork and we were already blown away; the visuals look amazing. As the name suggests, the game takes place in the Forest of Liars, which they have described as "a vast, lush labyrinth where explorers unmask the mysteries of a realm where many have entered but none have ever returned."

With narrative adventure games, one should expect to meet many interesting characters on their quest to reach the forest's heart and at the same time have many decisions to make during their journey.

From the looks of it, there also appears to be a class or skill type system and players will also need to strike a balance between themselves and the companions that they're travelling with. Umeshu claim there will be over 75 different character features with more than 15,000 possible combinations, so we're seeing replayability value here too.

There's a stellar cast working on this game, which is enough to warrant keeping an eye on it. Check them out on Kickstarter.

DREVO BladeMaster

Funding: US\$ 175,599 pledged of \$20,000 goal

Campaign link: <https://dgit.in/drevo>

The DREVO BladeMaster is called the "ultimate keyboard". So what makes it that? To start with, an array of features. One of those is a programmable "Genius" knob. The knob can be completely controlled using software, so you can adjust and remap the knob. The PRO version comes with cloud software and on-board memory support. Both versions of the BladeMaster come with Radi RGB, and the PRO version houses a 4000mAh battery.

The non-PRO version of the keyboard use Gateron RGB switch options while the PRO version of the BladeMaster comes with Cherry MX switch options. Both keyboard options are also available in multiple layouts.

The PRO version is available in wireless, with three different connection modes, Bluetooth, Wireless, and USB, with the ability to switch between the three modes on the fly. The wired or non-PRO version of the BladeMaster costs half the price of the PRO version and uses Gateron switches instead of Cherry MX switches.

mim X

Funding: US\$ 65,239 pledged of US\$ 15,287 goal

Campaign link: <https://dgit.in/mimx>

The mim X is a smartwatch, but its claim to fame is its invisible display. Yes, you read that right, invisible display. Of course, we don't mean there's absolutely nothing on the face. On the surface, the mim X looks like a classic plain watch, without all the clutter that comes with a smartwatch. However, the mim X uses something called 'Transparent Levitation Display' (TLD). TLD works by using a secondary display that's hovering or 'levitating' over the watch face, so when

the watch is not in use, it becomes completely transparent and you're able to see the watch arms clearly.

When you need to use the smartwatch's other features, the information is displayed on this "levitating" display. In terms of features you have all the usual features one would expect. You've got your message and call notifications, syncing two different time zones, an activity monitor, that includes a heart rate monitor, and a step counter. The watch can sync with Apple Health as well.

There are several customisation options for the watch in terms of looks, with various

different strap and frame designs and colours. There's also an option to get a magnetic wireless charging dock for the watch as well. Check the mim X out on Kickstarter if you're interested in nabbing one yourself.
