Fujifilm X-E3

An absolutely delightful camera

The Fujifilm X-E3 is a very strong performer, and delivers exceptionally well with JPEGs. The X-E3 produces great colour tones, which is aided by two things - the Dynamic Range modes for JPEGs and the Film Simulation modes. You get fantastic colour accuracy across a wide range of lighting conditions. The white balance is easy to get right, although you can simply leave it on Auto, and the white balance accuracy is excellent too.

The Fujifilm X-E3 delivers some of the best whites, along with solid, deep blacks and accurate shades of red, blue and green even when you leave picture control to standard and do not apply any of the film modes. It also has impressive dynamic range, and this leaves room for very well-detailed shadows and intricately coloured objects. This allows good room to post-process RAW files, while even the JPEGs themselves are processed well by the in-camera Dynamic Range modes.

This essentially optimises shadows, dark areas and highly exposed areas automatically within the camera, and this helps tune JPEGs into offering well-balanced lighting across entire frames when, say, you are taking photographs from inside a room with dim lighting, and there's a window in the frame that's too bright. You can actually partially compensate for the overexposed window, or extremely dark shadows.

The Fujifilm X-E3 also scores high in terms of overall sharpness, detailing and contrast levels. There is a taut nature to the contrast of colours and sharpening object edges, which can however teeter on the verge of over-sharpening. The X-E3 also suffers from slight bias towards warm colours, which leads to cooler shades

often appearing warmer with the auto white balance on offer. RAW file performance is great on the Fujifilm X-E3 too, and in continuous shooting, the buffer starts lagging the processing

queue after about the 20th shot, which is fairly acceptable.

The biggest con in the Fujifilm X-E3 is its autofocus performance. The total frame coverage is 50 percent horizontal and 70 percent vertical, which is quite less. It particularly struggles with objects that are around the corner of the frame, and even in bright daylight with AF Tracking mode. Continuous AF mode struggles particularly hard in difficult lighting conditions, which is where you'd need it most, and if you happen to be shooting a video in such conditions, it can quickly get annoying.

ISO performance is quite impressive, particularly high ISO ranges. The Fujifilm X-E3 was able to push ISO all the way up to ISO 1600 in a dimly-lit frame without pushing noise levels through the roof. This leaves a lot of room to play around with light without having to compromise on low details and accidental grain.

Where the Fujifilm X-E3 truly impresses are in the film simulation department, and if you would be shooting videos at all, make sure you give the 4K mode a miss, and stick to shooting 1080p at 60 frames per second.

Of the film simulation modes, Provia (standard) adds a grainy aesthetic appeal to footages and photographs, Velvia (vivid) highlights colour tones while adding its own, signature colour profile, Astia (soft) renders dreamy, soft-edged objects for an contemplative look, and Acros (monochrome) provide true B&W tones.

Build, Design and Handling

Fujifilm has removed a bunch of buttons and the flash module to make it slim and light. The large touchscreen display to the rear and its overall retro styling will attract plenty of eyeballs no matter where you're using it. Handling the camera may take a bit of time initially, but the large, clearly-marked dials on the top streamline usage. Most of the operations are done either via the touchscreen or the joystick, which can also be used to select AF points. The touchscreen and its interface are fluid and responsive, too.

Connectivity and Battery Life

The Fujifilm X-E3 has Wi-Fi and low-power Bluetooth connectivity modes, and while the app itself is not the most visually appealing, its clearly-written instructions will help setting up quite easy. First-time setup is a bit inconsistent, and accessing the camera's wireless setting is actually easier from the album and not via the Settings menu. Once you're paired, though, connectivity is a breeze.

In terms of battery life, the Fujifilm X-E3 lasts for 95 minutes of video shooting or 470 shots of still photography, whichever way you'd like it. It takes approximately one hour and 45 minutes to charge fully. Overall, it's an absolute delight to play with.
