

Getting started with building 3D objects on Sketchup for Web

Sketchup, formerly Google Sketchup, lets you quickly translate 3D objects from your imagination to the screen.

BUILDING 3D OBJECTS

Sketchup is an extremely user-friendly 3D modeling website which enables users to create geometric 3D models. The software is used by architects, interior decorators, hardware engineers, and the plain Jane or average Joe that just want a creative passtime. The web variant boasts simplicity and quality in an optimal mix and has a significantly easier learning curve.

WHAT YOU NEED BEFORE YOU START

A Trimble ID or Google Account for signing in

Signing in through a Trimble ID or your Google Account gives you 10GB of free storage space from Trimble Connect to save those awesome 3D designs.

A recommended web browser

Sketchup web relies on WebAssembly, an intensive, heavy-duty technology that will require a cutting-edge

browser. To ensure you get the best experience, we recommend you use Chrome or Firefox.

A computer or laptop

Sketchup web will work optimally with devices that have a good graphics card, an abundance of system memory and a strong processor that can handle complex 3D geometries.

CREATING A MODEL FROM A TEMPLATE

Want to start building your 3D object already? In order to

start, you will need to select a template on Sketchup web. A template will allow you to choose a form of measurement for your 3D model, in the eventuality that the user wants to 3D print their model. Follow these steps to select a template:

- Click on the Open Model/ Preferences icon on the top left side of the screen.
- In the menu that opens up, click on New Model.
- Select a template that matches your preference. Your options include feet and inches, meters and millimeters.

Selecting your model preference will open up your workspace. You are now ready to begin 3D modelling your desired object.

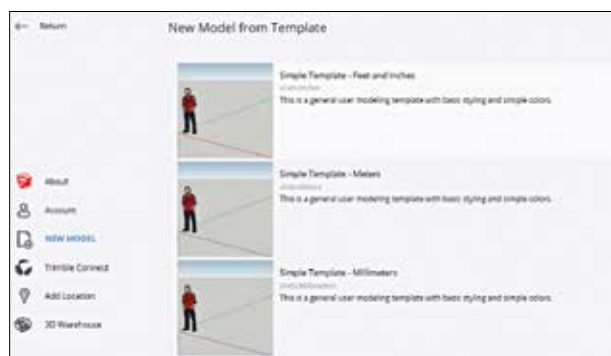

SKETCHUP TOOLS

It is absolutely essential to acquaint yourself with the multiple tools on Sketchup web since they are enablers that help you make your 3D model. The web version of Sketchup is fairly minimalist and doesn't have the wide variety of tools the downloadable version has, they make do with the bare essentials

which is perfect for beginners. Here's a list of all the important Sketchup for web tools that will get you started:

- The select tool. Select any entity of your 3D model with this tool.
- The eraser tool allows you to delete certain parts of your model.
- The paintbucket tool can add colours and textures, also called materials, to your model.
- The line tool draws straight lines. That's about it.
- The arc tool lets users create simple curves.
- The rectangle tool helps you create simple squares or rectangles.
- The circle tool lets you create circles.
- The push/pull tool lets you expand a flat 2D shape and make it 3D.
- The offset tool allows you to create an entity that is at a particular distance from another.
- The move tool allows you to move around entities in any direction.
- Pan lets you pan your view up, down, right or left, as needed.

Sketchup has simple tools that a beginner can get comfortable with rather quickly.

The default workspace will have this pre-made object that you can play around with.
