T

he personal computers have more or less retained its shape and form ever since they were first made.

In fact, the first computer ever i.e. the ENIAC was a huge rectangular machine that took up an entire room. Then came the IBM machines a few decades later which were similar rectangular bodies of much smaller sizes. Fast forward to present time and the most common form factor that you get to see when you search for a PC is the same old rectangle, though it's much smaller now. What we're getting to is that it's time for a change. Modding isn't a new concept at all. For us Indians, the hindrance was always the accessibility. Access to the right tools, access to the right materials and access to the right hardware. This is no longer a problem and enthusiasts have started modding PCs in the same league as International modders. Some of the things these guys come up with are awe inspiring.

Getting to the level of professional modders is no easy task, but there are a couple of things you can do to chart your path to modding glory. Let's take a look at some of the most popular ways people are modding various parts from their PCs.

CABLE MODDING

Perhaps, one of the simplest ways to mod your PC, cable modding refers to the act of taking the existing cabling from your PC and swapping out the cables for better quality ones, sleeving them with various colours to match

a theme or simply to refurbish your PSU's cabling. A properly done cable mod can make a world of a difference to your PC's aesthetics.

We could say that cable modding would be the simplest one in this article. The overall process is quite simple and straightforward if you have the right set of tools to get the job done properly. And getting those tools is quite simple online as well.

Post sleeving with new connectors

Just Google for cable mod toolkit and you'll come across hundreds of listings for teensy punch tools. These are what you'd use to separate the cable from the plastic ATX connectors. Once you've done that, you'll need to start the resleeving. Sometimes, the metal prongs at the end of the cables can get damaged or they're simply of a lower quality. In such cases, it's better to swap those out for thicker pins. What you need to worry about here is to not cut the cable down. Losing out on length can pose problems later on, so use a nose plier and pry the clips away. Tin the cable end with a solder-

ing iron if need be or simply attach the new clips and you should be good.

Now, you can move on to running a sleeve onto each individual cable. You can find these sleeves on all the e-commerce websites for cheap and you can even get them in a choice of materials. There are cloth sleeves, rubber sleeves and PET sleeves. PET is the best choice though the cloth texture is something a lot of people go for.

Cut out proper lengths of sleeve ending right before the metal clips on either end. And now, in order to stop the PET sleeve from moving about,
