

Smartphone storage deficiency? **Not anymore.**

BE IT AN ANDROID PHONE OR AN IPHONE, HERE'S HOW YOU CAN MAKE YOUR STORAGE TROUBLES DISAPPEAR.

How many times have you spotted a beautiful flower, a mesmerising sunset or a cute puppy with whom you simply had to take a selfie but were stopped from doing so because you had no more storage space on your phone? It's not just with pictures, you've probably faced memory shortage while downloading or updating apps as well. What do you do in this case? Delete the old pictures? Uninstall the less frequently used apps? If research is to be believed, then you're most likely to delete a picture of yourself before anything else. What if you were told that your act of selfless selfie sacrifice was completely unnecessary? There are plenty of storage solutions in the market and SanDisk has one of the widest portfolios to store your treasured memories and important files. Whether you're using an Android or iOS device, SanDisk has you covered and you'll never need to delete another selfie again.

Why external storage devices

Pictures and videos generally end up taking the most space in your device. With smartphone camera quality improving every cycle, more people are clicking pictures and recording videos. According to the Mobile Storage Solutions research (MSS) led by by SanDisk, a Western Digital brand, 6 percent of Indians never back up their files or data on their main smartphone. Among the ones who do, only 46 percent of them conduct back ups on their primary smartphones once a week or more than once a week. At some point, you will end up taking up the entire space on your smartphone. So, how frequently are smartphone users

SanDisk Ultra microSD UHS-I Card (400GB) –

With a massive capacity of up to 400GB, you don't need to worry about running out of storage space ever again with the SanDisk Ultra microSD UHS-I Card

SanDisk iXpand Flash Drive –

Free up space in your iPhone or iPad with the iXpand Flash Drive and transfer your data using the USB 3.0 connector to connect to your Mac or PC.

SanDisk Connect Wireless Stick –

Upload, download, save, share and play all your data wirelessly with the Connect Wireless Stick Link

deleting data from their primary device to make room for new data? According to the research, 83 percent of Indians have run out of storage at some point where 29 percent run out of space at least once a week while 62 percent end up running out of space at least every three months. You would wonder conducting frequent back ups would be the only way to avoid this problem. But the research suggests that from the 94 percent of Indians who take back ups, 46 percent do it on a weekly basis while 77 percent clean their storage at least once a month. Users aren't only backing up their data to make room for more data. Although 64 percent of the respondents lost an important photo or video because of not taking back ups, 67 percent were either fairly worried or very worried that the data on their smartphones wasn't secure.

Motivated by the joy of clicking new pictures, have you regretted deleting photos from the last trip to the mountains? If you do, then you fall among the 65 percent of Indians who wished they wouldn't have had to delete that precious photo or video just to free up space on their phones. Imagine this scenario where you are high above in the mountains or any location with terrible network coverage. You can't even rely on cloud backup solutions if you forgot to back up the previous photos and videos. So, your only option would be an external storage solution. Another fun observation coming from the research is that on an average, the Indian respondents took about 31 photos and 14 videos every week. With the megapixel count of cameras going up, imagine the total size of content you could be generating every week.
