

thing, we don't know much about the far side, because nothing has ever landed there. Secondly, the far side of the moon is shielded from all the electromagnetic noise that our planet generates. The cacophony that earth produces makes it impossible to study the heavens in as much detail as we like. It's like trying to study while a 24x7 death metal concert is happening next door. From the far side, we would be able to peer deeper into the past than we have been able to thus far, and who knows what this might reveal.

Mars is obviously a far higher value target for all space agencies and companies, but a manned mission certainly seems much farther away than what dreamers like Musk claim. We don't expect any manned missions to Mars in the next decade.

RENEWABLE / FREE ENERGY

More developed countries will push towards ending their dependence on coal. This means that coal generated electricity will have taxes and levies while renewable energy such as solar power will be made cheaper.

With skyrocketing fuel prices, we can expect the solar panel craze to spread across the world, especially in traditionally hot countries that get a lot of sunlight, such as India and Australia. We're not holding our breath for wind power to be able to grow too much more – certainly not as much as solar. It will be relegated to areas of the earth that don't get too much sun, and those are also (usually) the least populated areas of the planet.

Expect to see electric transportation become the norm in a lot of developed countries, and even in India, if there is a serious push towards electric cars. Renewable energy will go hand in

hand with electric adoption, and hopefully will lead to less polluted metro cities over the next decade in India.

AGRICULTURE

One of the biggest problems still facing the world is hunger, despite millions rising out of poverty and starvation, there are still hundreds of million

more who need to do so. Given that population estimates suggest that we will add on another billion people over the next decade, food is particularly of importance to us all.

With the emphasis on climate change and a fast growing under-standing in developing countries that meat products aren't the greenest

World's first Quantum Computer works... we think

Q_Base – the biggest collaboration in the history of technology, which brought together IBM, Intel, AMD, Google, Microsoft, Samsung, Qualcomm and many more – was finally turned on earlier today, after a year long testing run that was started in April 2025. Expected to immediately be the most powerful computer ever built, the Q-Base is sucking up power as it is still in the compiling phase. It took researchers almost five years to convert all the data they had into quantum bits and store it on the quantum holographic storage developed first by the Australian National University in 2017. The Q_Base is currently going through the 1.5 exabytes of research data that the researchers were able to provide it. It's not connected to the internet, but it is trying to make sense of what we've given it. Or so we think. It could just be doing nothing for all we know. Even now, no one really understands quantum computing totally, so we just have to wait and watch as it goes through the motions of parsing all that data and then hope it spits out something meaningful.

Because it's been given absolutely all our scientific knowledge, across all fields, there are protests from fringe groups erupting all over the world. The Hawkingsians are by far the most deadly of the lot, as they want to blow up or destroy all quantum computer establishments across the world. They hold steadfast to late physicist Stephen Hawking's warning that both AI and aliens will be the end of mankind, and try and prevent all AI research and also all space launches. Their worst ever attack was on SpaceX's Falcon Heavy program back in 2022, when they infiltrated SpaceX as engineers and managed to plant explosives on SpaceX's first Mars mission. The Falcon heavy program was significantly delayed after the incident, pushing back the schedule on SpaceX's ambitious plans to build a permanent base on Mars.
