

**Possible ninth planet?**

A 9th planet in our solar system (not Pluto) could be the newly discovered celestial object 2015 BP519. <https://digit.in/jun18-B26-1>

**World's most advanced camera..**

DARKNESS, will be able to directly image planets around alien stars and will help the hunt for another Earth. <https://digit.in/jun18-B26-2>

I

he first Wiki was known as Wiki-WikiWeb and was started in 1994.

Wikipedia was

launched in 2001. During this period, the technology gestated, waiting for just the right factors to make it relevant and widespread. There are a number of technologies that we come across, that are overhyped, and promise too much on what they can deliver, while still in the early phases of deployment. This deals with the future, and we could get stunning breakthroughs. As with the other articles in this issue, take everything below with a pinch of salt.

QUANTUM COMPUTING

Quantum computing promises to speed up computing power, because of the various quantum states available, instead of just binary. While the term may be common, we are very far away from having quantum computers everywhere. We don't even know what the quantum bit, or the qubit will be made up of — atoms, electrons, photons or some other subatomic particle. The materials needed to build the circuits and measure these particles are also currently under development. The few quantum computers that exist today are run in lab environments, at near sub zero temperatures. They have a high error rate, and they cannot process the number of qubits yet that would take their capabilities well beyond the scope of conventional computers. A lot of progress will be done over the next decade, but don't expect a consumer grade quantum computer. Even if a consumer ready quantum computer is invented tomorrow, there remains the question of roll out, and even ten years are not enough to make the transition from one computing paradigm to another.

SPACEX MARS BASE

The first Red Dragon mission to Mars is expected to take off a little after 2018. This is a pathfinding mission with the specific purpose of finding an ideal

IT'S NOT TIME YET

place to start building a Mars colony. After this, the first cargo mission to Mars on the Big Falcon Rocket is expected to start off in 2022. The ship is called the Heart of Gold, and will ferry a propellant plant. This will only happen if the new rocket is developed, successfully tested, and works as expected. SpaceX has not even sent a probe to the red planet yet. SpaceX has not yet outlined how it plans to mine the resources as raw material for

Most of the stories in this special issue focus on the things that are going to happen over the course of the next decade. But what about all the things that are improbable?
