

Digit by the Numbers

The machine that hosts Digit.in

We use Amazon's EC2 hosting, which scales as per requirements. We use between 4 and 10 load-balanced instances. Each instance has an Intel Xeon E5-2666 v3 at 2.90GHz, 1 processor, 8 cores, 16 threads. It has 30GB of RAM.

Energy Consumption

Even though we use one of the most energy efficient servers around, keeping Digit.in up and running consumes about 6,660 kWh every year. That is more than 6 times the yearly electricity consumption of an average Indian household.

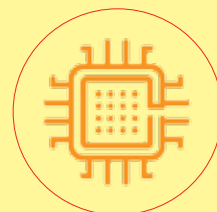

Average Bandwidth

The average bandwidth used is over 24 TB a month. That's about 1 year of 24x7 Netflix streaming in full HD. You would need to take 12 million selfies to fill that space, which would take about 11.4 years of non-stop selfie taking (2 per minute). Start snapping!

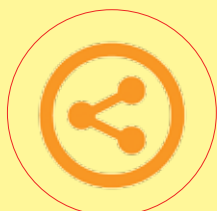

Maximum Bandwidth

The maximum bandwidth supported by the hosting solution for Digit.in, is 900GB in a day. The CERN Data Centre can transfer 10GB of data every second. It would take only one and a half minutes for the CERN Data Centre to use up our capacity.

1,500 Gigafllops of Peak Performance

The Indian Institute of Science, in Bengaluru houses India's fastest supercomputer, the SahasraT, with a performance of 1.2 petaflops. That is 800 times more powerful than the Digit servers. Both use Intel Xeon processors.

The No.1 Socially Engaged Tech Media Brand

Digit sees more than Reactions, Comments, Shares and Retweets than any other tech media brand in India. In the month of January 2018 alone, we clocked more than 650,000 interactions on social media platforms.

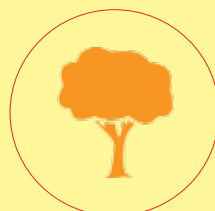

5,000 concurrent users

On a daily basis, we see an average of 5,000 concurrent readers. These are the number of people on Digit.in, at the same time. We have seen 20,000 concurrent users while covering events and after major announcements.

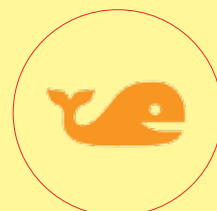

DVDs

We have produced a total of 20 million CDs and DVDs, a stack of which would reach 23,940 meters in height. That is 28 times the height of the Burj Khalifa, and the stack will stand taller than even Mount Olympus on Mars, the highest mountain in the solar system!

Trees

Without counting Fast Track, Dmystify and other supplements, we have distributed 1,410,250,000 sheets of paper with our content on it. That is somewhere between 700,000 to 1,400,000 trees. Don't worry all our paper is responsibly sourced from abroad and every tree cut is replaced.

Paper

0.5 percent of the paper used for publishing is actually wasted. Cutting wastage, printing errors, etc. That works out to 705,125,000 A4 sized sheets of paper. If laid out end to end, the sheets would go around the world five times. A stack of the wasted paper would weigh more than 25 adult blue whales.

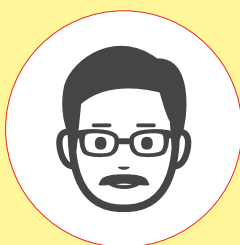

We have readers across all age groups
