

Fewer anti-biotics and more ADHD

Kids these days are being prescribed fewer anti-biotics but more and more are being put on ADHD medication. <https://digit.in/jun18-B32-1>

The Ocean is calming

There is scientific evidence that the sounds of ocean waves calms you down, and is good for your well being. <https://digit.in/jun18-B32-2>

Technology is heading towards revolutionising women's healthcare

Technology grows by leaps and bounds with every passing minute in today's dynamic world. It could inject a much-needed boost to the quest for efficient women's healthcare around the world.

T

echnology has become an intrinsic part of a human being's life and has transcended the

borders and limitations that were once considered insurmountable. It has achieved the unachievable, mastered the unfathomable and penetrated the impenetrable. However, in the recent years, several patterns are discernable that indicate the furthering of technology, first for entertainment and leisure, followed by what is really necessary to improve – the quality of life. IDA and LGDK's research paper on 'Technology and the welfare system' states that the needs of the elderly, disabled and people with chronic diseases have been left behind by technology to facilitate the desires

and wishes of the younger demographic, bringing them things like the home theatre system instead of making any significant progress in healthcare before that.

However, over a few years, technology is paving a path to bettering the standard of living in human beings. Slowly, but surely. Women's health care used to be one of those unexplored territories that is now gaining major traction over the past few years. Companies like Ava, Glow, PMS Bites, Prelude, and many more have captured this industry over the past few years and have considerably improved the lives women lead. The future looks no different. Technology seems to be

making up for the years of neglect by steam-rolling research and aid to this sector to make strides that will revolutionise women's health further in the coming years.

A PILL THAT CAN DETECT BREAST CANCER

Breast cancer is exceptionally common, with one in eight women likely to contract it at some stage in their life. Mammography is a method used to detect this cancer, although it is awfully antiquated. The method misses approximately one in five cancers, with numerous occurrences of false positives in women that screen themselves regularly. Mammography is edging
