

In the second half of 2018, India will launch its follow up lunar mission, the Chandrayaan-2, which consists of an orbiter, a soft lander, and a rover. NASA's InSight mission to Mars will arrive at its destination later in the year. The Xiaomi IPO is expected to land soon, and Samsung is probably going to debut a Bixby powered smart speaker. Magic Leap intends to unveil its VR display that projects images directly on the retinas. Beyond that, this is what to look forward to.

2024	2025	2026	2027	2028
 Parker Solar Probe flies into the sun The Parker Solar Probe is set to launch later this year will only arrive at the sun in 2024. It is spacecraft that will fly closest to the Sun.	 Less than half of all cars are privately owned Carpooling, car sharing, and car subscription services are expected to drastically reduce the number of cars in private ownership.	 Indian Space Shuttle begins operations ISRO hopes to begin operating its reusable spacecraft meant for manned flights, which can potentially double up as a space plane.	 Robotic helpers High net worth families are expected to have multiple robotic helpers in their homes to take care of everyday tasks such as cleaning and cooking.	 Deep Space gateway completed The Deep Space gateway is a staging area for technology demonstrations that are required for future missions to the outer solar system and beyond.
 Low cost 3D printed clothes 3D printing will be commonly and cheaply available, allowing for open source low cost 3D printed clothes.	 Commercial space travel Space tourism is a thing, filling the coffers of private spaceflight companies. We may even see the first luxury space hotel deployed.	 "Land Airbus" in China The "Land Airbus" is a mass transit vehicle on rails that allows other vehicles to drive beneath it. It is expected to start operations in China by 2026.	 4D printing commercialised 4D printing is essentially creating shape shifting objects with various uses, based on exposure to heat or water.	 Extinct species are resurrected A combination of gene editing, cloning and selective breeding is expected to bring back extinct animals. A cloned Pyrenean ibex survived for a few minutes in 2003.
 SpaceX sends BFR to Mars This might seem a tad optimistic, but SpaceX plans to send its first flight to Mars, a Big Falcon Rocket in the year 2024.	 Gadgets charged by Wi-Fi The University of Washington has already developed a power over Wi-Fi system that can juice up devices from a distance of about 30 feet.	 HL-LHC is operational The High Luminosity LHC will begin operations, that increases the energy levels of the particles faster, and allows bigger data samples in the experiments.	 Europa Clipper mission reaches destination The Europa Clipper mission that will taste geysers of water erupting from the south pole of the Jovian moon, will enter into an orbit in 2027.	 ISS is decommissioned The ISS is superseded by the Deep Space Gateway, so the ISS will end 30 years of operations, with some modules being reused for other space stations.
 Prosthetics convey sense of touch Robotic hands would get better at holding and manipulating things thanks to soft sensors that convey a sense of touch.	 Wiring map of the brain created The connectome of the human brain can allow researchers to conduct virtual experiments on a digitised human brain.	 PLATO is launched The PLANetary Transits and Oscillations of stars (PLATO) by the ESA has one mission - to find as many exoplanets as possible.	 Bees pollinate crops With natural bees dying out, drone swarms of robotic bees will need to be used to pollinate and monitor crops.	 China builds the largest accelerator China will finish building its 52-kilometer long electron-positron collider, which will be able to smash particles more precisely than the LHC.
 Satellites provide global internet broadband Starlink and OneWeb are two nanosatellite constellations planned that hope to provide low cost worldwide broadband internet services.	 Everyone is using AR glasses Augmented Reality applications are absolutely necessary for presentations, meetings, driving, classrooms, shopping and whatnot.	 Google speeds up the internet Google Fiber is rolling out connections that offer 1gbps, the next phase has 10gps connections.	 Worldwide Carbon sequestration Technologies are cleaning up the atmosphere. Pollution sucking "trees" will be deployed along highways, and the water bodies will have drones to remove the carbon dioxide.	 Debut of camera contact lenses Samsung, Google and Sony are all working on contact lenses with embedded cameras.
