

Lacie Rugged Secure

While we get that putting the words rugged and secure right after each other does seem a bit redundant, the Lacie Rugged Secure is all about protecting your data, both physically and otherwise, hence we can excuse the redundancy. It is a drop-resistant external storage device which has been designed to make it possible to even survive in sub-zero temperatures.

The Lacie Rugged Secure uses Seagate Secure, an encryption technology which is in addition to all the tech it usually puts behind securing portable hard drives. There's AES-256 hardware encryption, and for any other kind of threat to your data, the Rugged Secure also features a drop resistance up to 4-ft, which is higher than most desk heights, crush resistance in-case anyone accidentally sits on it or places something heavy on top of it, water resistance for situations like rain, and lastly, it's shock resistant as well.

Now for the other features of the Rugged Secure, the portable hard drive itself comes with a USB-C port, which

is compatible with both Thunderbolt and regular USB. Transfer speeds are fast, with Lacie claiming speeds of up to 110MB/s. The Rugged Secure comes with 2TB of storage capacity, which is great. The portable hard drive itself comes with a USB-C to USB 3.0 adapter. The casing around it is bright orange and surely stands out.

Additionally, the device comes with a 2 year warranty and 2 years Rescue Data Recovery Services. As a surprise, we also got a one month free trial of the Adobe Creative Cloud suit.

The device has hardware encryption which automatically locks the drive with a password once it is disconnected from the host PC.

The Rugged line of hard drives can be sufficiently pricey, but they pretty much guarantee the safety of your data, so it is completely up to you to determine whether you're willing to invest more money for a higher grade of security for your data.

Zhiyun Smooth 4

The Zhiyun Smooth 4 is a mobile phone gimbal that helps stabilise the device while capturing photos and video. We used the Zhiyun Smooth 4 and we have to say we were quite happy with it. The Zhiyun Smooth 4 can be connected directly to the phone that's using it to provide the user with even more capture options which are on the Smooth 4's handle. Unfortunately, the Smooth 4 is only compatible with high-end phone models. In a way this makes sense, because you don't expect quality cameras in lower-end phones. Regardless, we didn't really have too much difficulty using it with our regular phones and were still able to enjoy the stability the Smooth 4 provided.

Being able to connect with the Zhiyun Smooth 4 opens room for a lot more features, such as being able to use the handwheel on the Smooth 4 to control pull and zoom. It also has features like being able to take Vertigo Shots, POV orbital shots and roll-angle time lapses. It's also capable of detecting and tracking objects and motion. You can set the Smooth 4's frame on the object you want to track, which doesn't even have to be a human, and the Smooth 4 will apparently do the tracking for you.

Finally, the Smooth 4 is capable of simultaneously charging both itself and the phone that's attached to it. We're definitely going to be using this a lot in the future, look forward to more stable videos from us.
