

DOES THIS SECTION
EVEN NEED AN
INTRODUCTION?
FROM COMPUTERS
TO MOBILES, AND
HEADPHONES TO
GPUS, IT'S ALL
HERE...

THIS MONTH IN TECH:
We'll be having a quick
walkthrough over all
the major announce-
ments from WWDC and
Computex. Then we
try to figure whether
smart homes and home
automation are the same.
Finally, we take a look at
India's own navigational
system called NavIC.

Pixelbook running Windows 10

Google is adding
Windows support
to its hardware to
allow Pixelbooks to
run the Windows
operating system.

WWDC 2018: Where's the innovation?

Apple's annual developers conference lacked any eye-popping innovations this year. Here's everything that stood out.

Mithun Mohandas | mithun@digit.in

Apple's WWDC or WorldWide Developers Conference was sort of an antithesis of its name this year as they barely showcased any features that would interest developers and focused more on OS improvements and features. Something that Apple sorely needs to do since it has been years since we've seen any iota of innovation from the company that once made a habit of overusing the term across all their presentations. Moreover, given how bad 2018 has been for Apple in light of their iPhone OS/battery controversy and the MacBook Pro Keyboard fiasco that's been plaguing their laptops for quite some time now. Apple's theme for WWDC might as well be "Better late than never" as they introduced features that have been around on other platforms for ages. So what did you miss? Nothing spectacular but here are the highlights.

iOS 12

Stability and performance underlined most of the announcements made for Apple's latest OS for their mobile devices. iOS 12 is set to arrive later this year as a free update and a public beta should already have been out by the time you're reading this. iOS 12 appears as if it is compensating for the iPhone battery controversy by undoing all the nerfs that they'd implemented. The update will be available for every device that came out after the iPhone 6S. Apple claims that an iPhone 6S running the new iOS 12 will launch apps 40 per cent faster, bring up the native key-

board 50 per cent faster and take a photo straight from the lock screen 70 per cent faster compared to iOS 11. What would be interesting to see is if iOS 12 performance matches iOS 9 performance on the iPhone 6S.

CarPlay is a feature of iOS when docked with a car and Apple is now opening it up to third-party navigations apps such as Waze and Google Maps. It's nice to see Apple accepting

the age old saying that if you can't beat them, join them. Or atleast open up your API to third-party developers.

Next up for iOS 12 is the old Android feature of 'Grouped notifications'. Notifications will now be grouped as per app and topic, so you can kiss goodbye to all those hundred notifications that would clutter your tab every few hours and have a more organised and succinct notification system.

Innovation factor = 0/10

Screen Time

Apple's internalising the features of Screen Time, a parental control app that allowed folks to keep an eye on how their kids are using their phones and tablets. Screen Time which will now become a native feature of iOS 12 will produce daily and weekly activity reports that tells you how much time was spent across various apps and how many times the phone was picked up. Going one step further, Screen Time will also
