

In-Win 307

Another unique design that we came across at the showfloor was the In-Win 307 with an LED wall on the front panel. Although this doesn't sound extraordinary, it looks amazing because of the ability to control every single LED. There are 144 LEDs on the panel with several preset lighting effects added. The most popular was the Space Invaders effect. Out of them, the only functional effect we saw was the one that showed you the time. All the lighting effects are powered by the GLOW software where the animations can be changed at will. However, the pixel art might not look the best for everyone and not all of the effects appear well-crafted.

Der8auer's phase-shift cooler

If you've been following the overclocking scene, you're probably aware of Der8auer. At Computex, he collaborated with Berlin-based retailer CaseKing to showcase a prototype of their phase-shift cooler. Phase-change cooling is a technology you would find in refrigerators and air-conditioners. The same principle can be used to cool the CPU and, in this case, a block is placed over the processor along with a con-

denser in the closed system connected by a vertical tube. A copper heatsink is placed over the system with two 90mm fans to cool the condenser. Although it looks too bulky for now, both the parties are planning to make changes and launch a commercial product before the end of this year. The changes will reduce the size to be similar to a typical 240mm or 360mm AIO liquid cooler.

Intel Core i7-8086K

It's been 40 years since Intel released the iconic 8086 processor back in 1978 and the rest was history. To celebrate the 40th anniversary of Intel's x86 architecture, Intel revealed the 8th Gen Intel® Core™ i7-8086K processor. With a clock speed of 4 GHz out of the box, this is going to be the first Intel processor with a 5.0 GHz turbo frequency. The six core, 12 thread CPU is going to be a limited-edition processor so you should grab one before the stock runs out. However, the main attraction from Intel was their high-end desktop processor (HEDT) with 28-cores and 56 threads. They didn't reveal the name nor the architecture or process while showing off what it was capable of compared to the 18-core/36-thread Core i9-7980XE.

Cooler Master SL600M

Cooler Master is targeting the silent segment of cases with a bottom to top approach with the SL600M. Both the front and rear panels have been sealed off, so there's no air coming in or going out through them. Sound dampening material is added behind all the panels while the side panel could be made of tempered glass to show off the components. The SL600M is following natural heat convection which should theoretically provide the best airflow. Two 200mm fans are installed at the bottom, pulling in cool air. There's extra clearance below the case for more air intake. To avoid any airflow hindrance, the graphics card has been vertically mounted with some extra width added to the case so that the airflow isn't blocked from the bottom. On the top there are two more 200mm fans for pushing the hot air out of the case. The PSU goes at the front along with storage mounts.
