

MSI Prestige PS42

Mostly known for their wide range of gaming laptops, MSI surprised everyone at Computex with their new professional lineup called the Prestige. This is the first time MSI is entering the business side with a laptop solution. Sporting an elegant and minimal design with the brushed aluminium finish, the PS42 will surely

grab some eyeballs on your desk. It's thin (about 15.9mm) and lightweight at under a kilogram. The laptop carries the sleek design to the screen as well and has thin bezels to achieve a high

screen-to-body ratio. MSI doesn't disappoint on the ports by offering an SD card reader, two USB 3.1 Gen1 Type-C and two USB 3.1 Gen1 Type-A ports, a full-size HDMI out and a headphone/mic combo port. The touchpad has a fingerprint sensor so you're getting a good level of biometric security. Finally, just like many other MSI laptops, the Prestige also comes with audio enhancements through the Nahimic software solution.

SPECIFICATIONS:

CPU: Up to 8th Gen. Intel® Core™ i7 U-Processor CPU | **Storage:** 1x M.2 SSD Combo slot (NVMe PCIe Gen3 / SATA) SSD | **Display:** 14.0" FHD (1920x1080), IPS-Level | **Graphics:** GeForce® MX150 with 2GB GDDR5 | **Memory:** Max 16GB

Lian Li Strimer RGB

As the race to RGB-fy every PC component rages on, we now have RGB illuminated PSU cables. Well, they aren't illuminated literally. Lian Li has taken a smart approach to make it appear like your PSU cables have been given the latest illumination overhaul. The Strimer is an RGB module that attaches along the length of your cables. They are LED tubes over cables so the illumination makes it look like your cables are lit up. For starters, the company is only offering these modules for the 24-pin motherboard power cable. Since it's just an extension, it should be compatible with almost any cable out there. The module connects to your motherboard using an RGB header.

NVIDIA Isaac

Isaac is a robotics platform to power autonomous machines by bringing together NVIDIA's AI prowess to enable robots for manufacturing, logistics, construction and other industries.

It's basically three things put together - The Isaac SDK, Isaac IMX and Isaac Sim. And at the heart of the NVIDIA Isaac lies the Jetson Xavier which is a computer designed solely for robotics applications. It can perform sensor processing, localisation and mapping, vision and perception, odometry and path planning. This new platform comes packed with all the compute power to let an autonomous machine run on its own with little external interaction. The Jetson Xavier is an amalgamation of different processors that talk to each other simultaneously.

With all of these processors put together, the Jetson Xavier has 9 Billion transistors and delivers 30 Trillion Operations per Second. NVIDIA equates this to more processing capability than a workstation while using a third of the energy of a light-bulb. Essentially, the latest GTX TITAN graphics card is barely faster than the Jetson Xavier. The Jetson Xavier is the hardware part of the entire solution. The other half i.e. the software portion comprises of three things - Isaac SDK (collection of APIs and tools), Isaac IMX (Issac Intelligent Machine Acceleration applications, a collection of Robotics algorithms) and Isaac Sim (highly realistic virtual simulation environment to help train the autonomous machines). Jetson Xavier, along with these software libraries, can bring the level of AI computing power to the edge that was until now not possible. The NVIDIA Jetson Xavier developer kit will be priced at \$1,299 and will have an early access programme starting in August 2018.
