

SECURITY WATCH

macOS bug reveals encrypted data

A decade old issue seems to have cropped up again on Apple's macOS and is directly affecting the privacy of password-protected files on encrypted drives. Earlier this month, security researcher Wojciech Regula from SecuRing explained in a blog post that the 'Quick Look' feature was to blame – something originally designed to let users get an easy preview of photos, documents, files and folders without actually opening them. The cached thumbnails that provide this preview are stored in a system's non-encrypted drive at a known and non-encrypted location, ending up revealing the contents of the encrypted drive anyways. The issue has apparently been known for eight years but has still made it to the latest versions of the operating system.

MOBILE WATCH

The Atom

As smartphone flagships grow bigger and more powerful, they also seem to be headed towards an inevitable state of fragility. Most of the current flagships aren't build to survive a direct drop onto the floor. To provide smartphone users with an alternative, Atom, by Unihertz, is an upcoming crowdfunded smartphone (that has already reached almost 2000% of its initial goal) that features flagship specifications in a rugged and tiny body. Featuring an IP68 certification, an Octa-core CPU, dual cameras, 4GB/64GB memory, NFC and fingerprint scanner among other features, the Atom comes with a 3.7"x1.7"x0.7" body and weighs a 108gms. The phone also supports dual nano SIM cards and comes with Android 8.1 Oreo pre installed. Unihertz has also created a number of helpful mounts that will make the Atom truly portable.

APP WATCH

Steam Link

If you have anything to do with PC gaming, you've probably been using Steam. Consequently, you probably have a huge library of games. Steam Link is an app that changes the way you've played games on your PC - by bringing them to your phone. No we're not talking about mobile ports.

You install the app on your phone and it detects the systems with Steam accounts on the same network. Once it has done that, you have to select which

PC you'd like to connect to. After you tap on that, a code is displayed on the phone which needs to be entered on the prompt generated on the corresponding PC. Once that is done (and maybe a few pending updates) you'll find your-

self on the familiar Big Picture screen which lets you do a bunch of stuff like fire-up games from your existing library or even make new purchases.

The app essentially streams your desktop - both the visuals and the audio. The app lets you configure the streaming quality to ensure optimal performance and graphics as well. You can also set advanced features such as Performance Overlays and HEVC.

As the initial diagnostics recommend, you should have a 5GHz network for optimal experience. We did experience a few lags on slower connections. Additionally, not all games translate too well to the limited touchscreen options, although a controller makes up for most of those problems. But for the ones that work well, this definitely feels pretty convenient as an app to have around. P.S Try Super Meat Boy for a seamless experience.

OnePlus Gestures

No, this app is not from OnePlus and it is not free. It is a simple gesture control app that is inspired by similar features on the popular smartphone range and can save you a lot of time when navigating your phone.

Ecosia Browser

Just Ecosia on iOS, this browser/search app offers you nothing more than a standard, slick feature rich browsing experience. So why are we recommending it? Ecosia plants one tree for roughly every 45 searches made.

SoloLearn

Need a quick refresher on basic programming skills? Or looking to start off on some of the popular languages? SoloLearn is an easy to use app that gives you byte-sized lessons on how to code. It even lets you practice!
