tion messages, and monitoring and control of ground facilities including ranging stations of IRNSS.

The first satellite was scheduled to launch on June 12, 2013. But initial checks on the fully integrated launch vehicle a couple of weeks before launch threw up some anomalies in the electro-hydraulic control actuators. After this issue was fixed with a replacement, the 1425kg IRNSS 1A was launched on 1st July, 2013 at midnight, aboard the Polar Satellite Launch Vehicle-C22 (PSLV-C22). The launch was conducted from the first launch pad at the Satish Dhawan Space Centre, around 80 km from Chennai. This was also the 23rd successful flight of the PSLV series and reinforced India's space launch capabilities. After five orbit maneuvers were successfully conducted by the master control facility, the satellite reached its geosynchronous orbit with an equator crossing at 55 degrees east longitude about July 14th.

THE CONSTELLATION GROWS

The next satellite of the constellation, the IRNSS 1B was launched successfully on April 04, 2014 aboard the PSLV-C24 - less than seven months after the launch of its predecessor. After a flight of about 19 minutes,

IRNSS-1B Satellite, weighing 1432 kg, was injected to an elliptical orbit of 283 km x 20,630 km, very close to the intended orbit. At that point, the IRNSS 1C and 1D were scheduled for launch in the second half of 2014 and the entire constellation was supposed to be completed by 2016.

By September of the same year, ISRO had released the Signal in Space ICD for the IRNSS project. This document provided information on the signals and structures of the IRNSS system, including signal modulations, frequency bands, received power levels, the data structures and their interpretations, and user algorithms. This information is crucial for anyone looking to put the IRNSS' offerings into use - for research and development or for commercial purposes.

The IRNSS 1C, the third satellite of the IRNSS constellation, was also launched as per schedule on October 16, 2014. At this point, only one more satellite was required for the IRNSS to become operational, which was scheduled to take place in the next couple of months. The IRNSS 1D was initially scheduled to be launched on March 9, but had to be rescheduled to the end of March 2015 due to some anomalies being detected in one of the telemetry transmitters of the satellite
