

Nex Phone with no bezels

Vivo's Nex Phone has no bezels, no notch, a pop-up selfie camera, and an on-screen fingerprint sensor. <https://digit.in/jul18-33-1>

Fortnite reaches 125 mil players

Fortnite has acquired 125 million players within a year which makes it bigger than LoL, says Epic Games. <https://digit.in/jul18-33-2>

Samsung 860 Evo 250 GB SSD

Too pricey in its segment

The 860 Evo uses Samsung's fourth generation technologies including the 3D-NAND and the MJX SATA Controller. We see that the 860 Evo is now using LPDDR4 which is more power efficient compared to the older LPDDR3 that's used on most of the older SSDs in the market.

The Samsung 860 Evo is no doubt a good SSD to go for. You get good performance and a 5-year warranty period. Moreover, the improved MJX controller and the use of LPDDR4 ensures that your power consumption values are much lower than expected initially. Since the Samsung 860 Evo is still using TLC NAND, it does suffer

from the typical characteristics of the older technology. We observed that both the Intel 3D Xpoint devices (760p & 800p) seem to offer better sustained and bursty performance. We ran the mixed workload benchmark which is more

indicative of your average day to day usage where reads and writes are interspersed. It appears that the Sam-

sung 860 Evo is definitely better than the Intel 760p, however, the newer 800p still leads the race.

In order to compete in the budget segment, Samsung needs to drop the prices and match international pricing.

The Kingston UV400 is actually more expensive than the 860 Evo in American and European markets at \$82 while the 860 Evo costs \$79. In India, we see the tables turned.

—Mithun Mohandas

SPECIFICATIONS

MODEL: 860 Evo 250GB | MEMORY TYPE: 3D V-NAND | SEQUENTIAL READ: 550 MB/s | SEQUENTIAL WRITE: 520 MB/s | 4K RANDOM READ IOPS: 98K | 4K RANDOM WRITE IOPS: 90K | INTERFACE: 2.5-inch | MTBF: 1.5 Mil hours | ACTIVE POWER: 2.2 W | WARRANTY: 5 years.

Zebronics Orion

Impressive mic, mediocre audio

Zebronics is trying to place the Orion gaming headset in the mid-range but leaning towards the entry-level. Comfort is clearly the top priority here considering the suspended headband design, usually seen on higher-end headphones which are now making their way to the lower segment. The headband is made of two metal pipes with a cushioned strap to sit on your head. The cushioning under it which could have been better. It's flexible enough to accommodate big head sizes. The earcups are made of plastic with a glossy and metallic finish. Overall, the headset has a mediocre build quality and the cushioning will

ensure you can wear the Orion for long gaming sessions.

Audio performance is average on the headset. The soundstage is narrow and the sound signature is

close to neutral but not as good as the HyperX Revolver S. We weren't really

impressed with the bass response as it lacks the punchy and heavy feel. This makes the sounds of explosions, gunshots and vehicles a little underwhelming in games. There's one aspect where the Orion shines and that's microphone performance. Vocals sound natural without any audible enhancements. Zebronics could have made it much better by including some noise cancellation and a pop filter.

Considering all the shortcomings and interesting aspects, at this price we would recommend the ASUS Cerberus V2 over the Orion. Not only do you get a similar performing microphone but better audio reproduction in the drivers and modularity.

—Abhijit Dey
