

OnePlus 6 security flaw

A security flaw in the OnePlus 6 allows anyone with physical access to bypass a locked bootloader with any modified boot image. <https://digit.in/jul18-45-1>

Summit Supercomputer

ORNL launched the Summit Supercomputer which is the world's most powerful and most intelligent scientific supercomputer. <https://digit.in/jul18-45-2>

difference brought about with a high-end GPU is minimal. So yes, a GTX 1080 will be better than a GTX 1060 but in a real world test the difference will be about 3-4 seconds on average. So if you're using something like Premiere Pro or FCP, you can make do with a GTX 1050 Ti or an RX 470 as long as your CPU is powerful.

Now that the GPU is out of the way, you need to worry about the

CPU. Well, this isn't as complicated as the GPU and the simple rule of the thumb is that more cores are better. Previously, buying a server CPU was the way to go since core counts across mainstream CPUs were limited to just four. Now that mainstream CPUs like the Ryzen 7 1800X or the 2700X pack eight cores, you're better off getting one. In fact, even the HEDT platforms have got a lot more SKUs to choose

from these days. Intel has the Core i9-7980XE which absolutely wins the race but it also comes at a really high price. So the more economical option ends up being the Threadripper 1920X from AMD, not the 1950X because that's a bit pricey too. So while most of the suggestions in our Killer Rig fits the bill, you're better off deciding on the CPU and GPU after analysing your style of editing.

BUYING ADVICE

RENDER MACHINE

Q Hello, I read your AMD Ryzen 7 2700X review which was published in Digit last month and I'm an architect. For my daily use I regularly make use of 3DS Max, Lumion, After Effects, Sketchup, Photoshop, and Maya as well.

I'm planning to buy a new desktop so please help me out with putting together an efficient desktop for purposes such as video editing, 3D rendering and building walkthroughs using Lumion and Maya. Which CPU would be more useful? An Intel Core-i7 8th Generation CPU or the latest generation AMD Ryzen 7 2700X that you reviewed?

—Mritunjai Dubey

A Hey Mritunjai, Given the tasks you've listed, you need a CPU with as many cores as you can get. However, you have not mentioned the budget for your system. Given the uncertainty of your needs, I'm going to point your attention to the Killer Rigs section in which we've highlighted a system just for your needs. Certain functions of rendering software also offload tasks on the

graphics card, so you'll need a decent card as well. I'm guessing you'd want to retain existing hardware that you already own such as the cabinet, keyboard, mouse and the monitor. So here's everything else that you'll need.

Processor	AMD Ryzen 7 2700X + Noctua NH-U12S SE-AM4	34,388
Motherboard	PRIME X470-PRO	15,750
RAM	2x ADATA XPG 3000 MHz 8GB	13,800
HDD	Western Digital WD20EZRZ 2 TB + Samsung 960 Evo 500 GB	25,550
Graphics Card	Inno3D GTX 1070 Ti iChill X3	43,300
PSU	Seasonic M12II-750 EVO	9,350
Sub-total	(Excluding Monitor)	₹1,42,138

If you have a bigger budget then you can move to an Intel HEDT processor which will cost a lot more and will offer depreciating returns. Depending on your exact budget, that's entirely your call.

A LAPTOP FOR THE SAME

Q Dear Agent001, First of all, let me just say that I'm a huge fan and a long time Digit reader. Now back to business, I wish to buy a Dell Inspiron 15 Gaming 7567 15.6-inch laptop with an extra 128 GB SSD with the main purpose of basic editing and animation.

Will this configuration be enough? If it won't be, can you please suggest me a suitable upgrade?

—Samarth Shrivastava

A Hey Samarth, The Dell 7567 is now an older model and there have been newer systems in the market which have moved up to the 8th Gen Intel platform. Normally, generational differences between CPUs would be minimal, however, given the renewed competition between Intel and AMD, both companies have pulled up their socks and have started releasing way more performant CPUs. So moving to the 8th Gen Intel platform is more important. The 7567 series are still running 7th Gen and they have not upgraded.

So your options now lie with MSI, Acer, and ASUS who have all released updated versions of their gaming laptops. Incidentally, gaming laptops, apart from being good with gaming (obviously!) are pretty decent at 3D modeling and video editing as well. In particular, the MSI GL63 8RD would be optimal because it gives you the GTX 1050 Ti coupled with the 6-core Intel Core-i7-8750H.

On top of that, you get 2-years warranty with the MSI laptop. All for ₹89,990. Also, if you happen to get it from any of the popular e-commerce sites during a sale or from Paytm Mall, then you can get ₹6,299 as cash back bringing the overall cost down to ₹83,691 which would pretty much be the lowest price for this configuration.
