

KeyWe

Funding: US\$ 242,174 of \$30,000 goal

Campaign: <https://dgit.in/keywe>

The KeyWe is a smart lock, which comes with 6 different ways to open a door. That's not very reassuring when you think about it, but they're all fairly secure.

The first thought that we had when we saw the lock was "it looks fancy, but we could probably just break it and enter". But that's not so, the KeyWe is pretty strong, and has apparently been built with aluminium used to build airplanes and ships, it also comes with an Ansi Grade 2 Deadbolt. Also, there's a video of the KeyWe surviving a car being driven over it. That must mean it's strong... right?

Anyway, moving on, the KeyWe uses 128 bit AES encryption between the KeyWe app and the door lock; signals between the hardware and the lock are also encrypted and, according to the creators, constantly updated.

Attempted jailbreaks or detected rooting causes the app to block login and delete all data.

The benefits of the KeyWe come with its ability to easily lock and unlock with six different ways to do so. In addition to having a good old solid key, you can use a pass-code, NFC, an auto-lock and unlock feature to open the door. You can also give out a one-time use key for delivery executives or a limited time key for guests. Pretty smart for a smart lock.

GoCube

Funding: US\$ 390,772 of \$25,000 goal

Campaign: <https://dgit.in/gocube>

There's a smart version for pretty much everything nowadays, and the Rubik's Cube is no exception. The GoCube is a smart cube. This basically means it's connected and you can track your moves and the cube as you attempt to solve it. This is a great way for those who are trying to learn the Rubik's Cube and improve their skill with it. And it also provides a platform for people to compete with each other by comparing times and stats which are even easier to track now thanks to the GoCube.

The GoCube comes with smart sensors which continually track activity. This along with Bluetooth 5.0 connectivity. Embedded IMU helps with orientation and position. Oh and the whole thing can light up. The GoCube app comes with all the features you need to get started with solving the cube. You can even play several other different games with the GoCube. It's also a speed cube, so it's not very clunky and is built for speed solving.

Ample

Funding: US\$ 80,913 of US\$ 11,574 goal

Campaign: <https://dgit.in/ampleb>

The powerbank is an almost fundamental part of everyone's lives nowadays. Unfortunately they can get quite bulky and you have to deal with cables as well. The more devices you have that need charging, the more tangled cables you have to deal with. That's where Ample comes in. Ample is a slim, or in their words, an 'ultraslim' powerbank which has no external cables. The

cables are integrated into the sides of the Ample which can easily be removed and plugged in to your desired device. This basically eliminates the need to carry external cables.

Additionally, Ample offers automatic power on and pass-through charging capability. This allows you to basically use the Ample to charge other devices while the Ample is plugged into a single USB power source.

So tl;dr: Ample provides 5000 mAh of fast charging and is easy to carry around and comes without the hassle of having to deal with cables.
