

First YouTuber may return

Jawed Karim, YouTube's co-founder, may return to the platform after posting the first video on YouTube in 2005. <https://digit.in/jul18-69-1>

YouTuber watches Infinity War...

...44 times in the movie theatre! Tony 'Nem' Mitchell vows to continue this streak for as long as possible. <https://digit.in/jul18-69-2>

Harold "Doc" Edgerton, a professor at MIT used a stroboscope to revolutionise high speed and multi flash photography, capturing some of the most iconic images ever. He was nicknamed "Papa Flash".

This is the first few microseconds of an atomic bomb, photographed from 11 kilometers away, with a ten foot lense. The exposure was 1/100,000,000 of a second.

To capture this image, a microphone was used to trigger the flash when the bullet was fired. The image was first shown in a lecture titled "How to Make Applesauce at MIT".

Edgerton's innovation here was developing a flash that was short enough, and yet intense enough to capture a sharp image of a splash.

A multiframe image of Edgerton's youngest son, Robert, running. 10 exposures are captured every second to produce the final image.

Images like this captured gymnasts, athletes and even circus performers in motion. This is the famous golfer, Densmore Shute.

This image of a single flying fish gliding, actually uses a combination of two negatives, and was extremely challenging to capture.

This high speed photograph shows swirls of smoke interacting with blades of a fan. The fan appears frozen, although it is moving.
