Moon Pod

That doesn't sound like the name of a beanbag, but it is. So why that name? Because according to creator John Fiorentino, the Moon Pod is a "Zero-Gravity Beanbag" engineered to deliver a "full-body weightless sensation". If that's true, we're already sold.

How does it work? Well, it works like any beanbag really, an outer casing encapsulating thousands of beads. One of the things that differs with the Moon Pod, we're guessing, is the quality of the materials used. The outer cover is designed to blend in with modern homes and is machine washable. It's also pet friendly, so you should have no problems if your pet likes to scratch things or have a rest on it. The other is the shape, it's not similar to most generic beanbags we've ever seen. The microbeads in the Moon Pod are much denser than beads used in generic beanbags, which makes the Moon Pod surprisingly supportive, supporting your back if you wish to sit up straight etc. They're also light apparently, with the Moon Pod weighing only 6Kgs.

Xbox Adaptive Controller

The Xbox Adaptive Controller is a controller from Microsoft designed for people with disabilities. The name of the game is adaptability, and this particular controller allows for a lot of it, it's in the name after all. The adaptive controller has two large programmable buttons and 19 (19!!) jacks which can be used to connect to a wide range of joysticks, buttons, and switches to make it easier for anybody to play games on an Xbox One or Windows PC.

The aim here is to let users customise the controller to the way they want to play. If they want to play entirely with their feet, they can. The best part is it's not difficult to set up, and you can switch it around as and when you want or need. Microsoft have ensured that the process is as easy as possible. Would defeat the purpose if it wasn't.

The Xbox Adaptive Controller is expected to go on sale later this year for around \$100.

Kitty Hawk Flyer

The Kitty Hawk Flyer is a personal flying vehicle. One glance at it will tell you why it's not specifically called a hovercraft or a plane, because it looks more like a cross between the two.

The Flyer is an all-electric, single-seating flying vehicle which can currently hit a top speed of 20mph. That's currently, future designs estimate the Flyer could even hit 100mph.

In its current state, the Flyer is just a "recreational vehicle" according to Kitty Hawk CEO Sebastian Thrun. It only has a flying time of 20 minutes, but he says that one day it could be used to transport people around cities. He adds that the goal of his company is to eliminate road traffic.

The Flyer features 10 sets of rotors, and is controlled with two control sticks. It's not difficult to fly apparently, with those

who've tested the Flyer claiming it only took them about an hour of practice before they could fly it successfully.

The ease of use comes with a software the Flyer uses. The software utilizes data from multiple smart sensors to fully stabilise the vehicle and ensure a "smooth flying experience."

Once again, this is not a hovercraft, it's a full-on personal flying vehicle.
