Yepzon Freedom

The Yepzon Freedom is a personal safety device and GPS tracker that can be used for various purposes. It is roughly the size of a car key, and comes with a SIM-card embedded within the device. You just need to activate it by downloading an app and scanning the attached QR code. From then on, the setup is about as simple as it gets. There are three modes, which can be remotely controlled. The quick location mode continuously tracks the location of the device in real-time. In the power-saving mode, which is recommended for typical use, the device can be configured to ping its location in periodic intervals. The connection intervals allows you to specify the time between pings. Depending on the use-case, you can set this between one minute to six hours. The SOS button mode activates the device only when the SOS button is pressed. This is the mode to use if the device has been purchased for safety purposes. Once pressed in this mode, the person with the paired phone is alerted, and the location is tracked

continuously. The device can also be configured to beep out an alert alarm. The alarm is of moderate volume. The SOS button is the only button on the device. Once paired with a particular smartphone, the user can subsequently authorise multiple other users to also track the device, and be alerted when the SOS button is pressed. The main advantage the tracker has over smartphone applications is its long battery life. It can go for a week or more without being charged, depending on the mode being used. There are

various ways the tracker can be used, beyond just a safety device. The form factor allows you to hide it discreetly in a car, and track the vehicle if it is stolen. It is light enough to be attached to the collars of dogs, but might be too bulky for use with smaller cats. It can also be kept in school bags of children, or used by senior citizens. The variant without the SOS button is available for ₹5,999, while the variant with a SOS button is available for ₹6,999. A single smartphone can be used to track multiple Yepzon Freedom devices.

X-mini Nano-X

People have all kinds of requirements from audio products and Bluetooth speakers are no different. Some people want theirs compact, some want sturdiness, while some demand sheer performance. If you fall among the first group, the X-mini Nano-X will take things to a whole new level for you.

This tiny speaker, priced at ₹1,790, packs a powerful punch with its 33mm driver while being no bigger than a volume knob on many audio setups. Weighing a paltry 48g, the unit features a metal grille on top and a singular

button on the bottom for playback control - and that's it. The included LED indicators convey the pairing and battery status. The 300mAh battery can be charged via micro-USB and can power the speaker for a good five to six hours. The 2 watt audio output is enough to cement its position among the best in terms of size-to-loudness ratio. You obviously shouldn't expect significant bass or non-distorted audio at high volumes. It also comes with a built-in microphone that makes it a perfect device for conference calls in a small-to-medium sized meeting room.
