gamepad? We've com-
pared the best ones!

Tracking even with GPS off

By using other sensors
such as the magnetometer,
accelerometer and the
gyroscope, researchers were
able to track a smartphone's
location even with its GPS
functionality turned off.

WHAT'S NEW

World's strongest Net Neutrality rules adopted by India

India's Telecom Commission endorsed TRAI's (Telecom Regulatory Authority of India) recommendations on Net Neutrality, and thus, we now have the world's strongest Net Neutrality framework. TRAI's tweet on this issue says that the government has taken an unambiguous stand on the issue. Net Neutrality requires internet service providers to treat all forms of content in the same manner and not favour one or the other. Net neutrality discussions have been taking place all over the world with some countries like the USA even backpedalling and repealing existing net

neutrality laws. Exceptions and outliers to the rules have been outlined in the framework leaving nothing open to interpretation.

Consumers returning new MacBook Pros because they can't reach advertised speeds

Apple's newly released MacBook Pro models are facing issues and early-adopters plan to return them. The new MacBook Pro models are configurable to use the newly released Intel Core i9-8950HK which is a 6-core/12-thread CPU which can go all the way up to 4.8 GHz. However, the new devices have difficulty in hitting the advertised speeds

because the laptop's inbuilt cooling systems cannot keep up with the heat generated by these high-power CPUs. CPUs

have inbuilt safety mechanisms which throttle the CPU should it heat up too much and go out of spec. While this was attributed to a bug which was resolved with a software patch, that was not the end of the road as another issue pertaining to the T2 Chip and it's Bridge OS popped up, leading to crashes.

Uganda taxes social media access, folks unhappy

The Ugandan Government has levied a new tax to access social media. Users now have to pay a daily levy of UGX 200 (Rs.3.72) to access social media websites in addition to internet data fees.

WPA3 for Wi-Fi makes it harder to crack

The Wi-Fi Alliance has announced WPA3 which will be used to secure Wi-Fi passwords making them a lot more harder to crack than they currently are. The new standards will be made available through firmware updates.

Over 800 cryptocurrencies now dead

Bitcoin has fallen by roughly 70 per cent since its record highest value of \$20,000 last year. During the crypto high a lot of new cryptocurrencies were being issued and as the market hype died down, so did many of the low-value coins.
