

## SECURITY WATCH

## In China, state data centres get Apple data

**T**o comply with new regulation, Apple moved the encryption keys and data for its Chinese iCloud users to local servers in China back in February. For this to happen, Guizhou-Cloud Big Data, a Chinese company, signed a deal with Apple that gave them operational control over iCloud in China. As it turns out, that data has been transferred to Tianyi cloud storage services, a company managed by government-owned China Telecom. This data includes emails, text messages, pictures, and the encryption keys that protect it. This makes it easier for the Chinese government to access iCloud data and it could not have been done without Apple's approval. To work around this, all Apple users need to do is to choose a different country when setting up their iCloud accounts - although it's not clear what happens to existing iCloud users in China.

## MOBILE WATCH

## Jio Phone 2

**D**uring this year's Reliance Jio AGM, there were a bunch of announcements, one of which was the Jio Phone 2. It features a 2.4-inch QVGA display and supports dual SIMs. The device is equipped with 512MB RAM and 4GB internal storage, along with microSD card support of up to 128GB. It sports a 2MP rear camera and a VGA front-facing sensor. The handset comes with a QWERTY keypad with a four-way navigation key, which reminded us of BlackBerry devices, and is powered by a 2000mAh battery. The JioPhone 2 also runs on KAI OS and supports VoLTE. All the features detailed till now are exactly the same as the Jio Phone, however, the new handset supports LTE Band 3,5,40, along with 900/1800 MHz 2G bands and eMBMS.

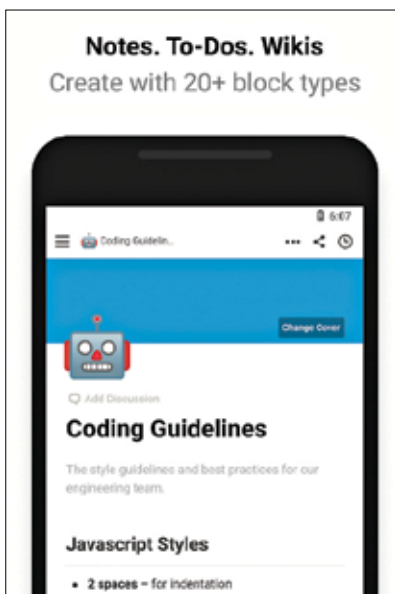

## APP WATCH

## Notion

**W**hen it comes to collaboration tools, team Digit isn't a big fan of many. In fact, it often turns out that the added complexity of using multiple collaboration and productivity tools ends up having the opposite effect. So what if there was one tool that could replace multiple alternatives? Notion is an editor that aims to combine tasks, notes, wikis and more under one umbrella. While the platform also has a web editor and a desktop app, we're talking about the mobile app here. You

get private and team workspaces, under which you can create Pages, which, in turn, can have sub-pages. Now this 'Page' is essentially your playground. It could be a simple blank text entry to take notes. It could be a Trello like task management layout to keep track of your work. It could be calendar shared between your team. It could be an excel sheet and more. There are a bunch of useful pre-made templates that can help you unlock its full potential.

If you're thinking that this app is just a bunch of useful templates you would be wrong. It supports a number of useful features like drag-and-drop, real time collaboration, offline editing, rich media content and more. The best part? Most of it is free.

### Revofit

Providing a number of health services and features under one app, Revofit aims to be a one-stop health solution.

Plan your day with meal and water intake logging, take up challenges and workouts, engage with the community and more.

### Like

Like is more than just another popular dubbing-based app. It takes things one step further by providing video

effects that are motion sensitive, along with other visual editing features like real time physique customisation and more.

### Klook

Travelling to someplace new but don't know how to organise your trip? Klook offers a platform for you

to book local experiences depending on your location. You can even make the bookings within the app itself.
