

And now, you want to save all of these links together so that you can come back later. How do you accomplish this? Do you create a word document and paste all the links? That would be way too tedious. The easy way would be downloading the Session Buddy extension. It automatically creates sessions of all the links open in your browser and saves them. You can choose to select a few and save them under a custom name. All these tabs are saved locally. Unfortunately, there's no cloud backups yet,

lagging and tearing. During such situations, you could either close the unnecessary tabs or you could install an extension called The Great Suspender. It does exactly what it says. It suspends the tabs so that they don't keep hogging all the RAM. Once suspended, the tabs become inactive and are automatically unloaded from the memory. To suspend a tab, all you need to do is open the tab, click on the extension's button and select "Suspend this tab". The webpage will disappear with its link posted

Toby enables you to organise multiple tabs under collections

Multiple sessions can be saved to be used later using Session Buddy

so you'll have to ensure that you take the files with you if you're formatting your PC. Backups can be taken for all your saved sessions. They can be later restored to regain access to those sessions on a different machine.

It's widely known that Chrome is always hungry for some RAM. So much so, that it will take up most of what is available and hold onto it. This becomes a huge problem if you own a PC with low memory. After a few tabs, browsing the web through Chrome becomes a painful process with all the

on the top. Whenever you want to activate the tab again, you can click on the link or press on "Unsuspend". From the Settings menu, you can set a timer for how long you want the tabs to be suspended. You can select the tabs to never be automati-

cally unsuspended or set a timer between 20 seconds to three days. The Great Suspender also saves your sessions. However, you can't save these sessions or name them. If you're using Chrome on a low-end machine with low RAM, you should definitely install this extension.

We've taken care of saving different sessions so that we can revisit them later and even prevent accidental loss of websites. Then we looked at how we could make the most out of Chrome by limiting the activity of unimportant tabs by suspending them temporarily. Now we arrive at the most crucial moment and that is organising all the mess. Having multiple tabs opened up can actually be important if you're

multitasking. You can't afford to have few open tabs since your work demands you to monitor 20 different things across 50 tabs. An extension by the name of Toby steps up to make sure that the mess is cleaned up. Tab management is its primary objective and it does that pretty well. You can create Collections where you can add tabs based on a topic. For example, you can create a collection for your work-related tabs including your inbox, drive and maybe an active document. Another collection could be created to include all your research-related tabs. One collection could include all your social media tabs. The possibilities are endless.

After creating the collection, you can drag the tabs from the column on the right. You'll notice that they start disappearing from the main window. If you wish to go back to those tabs, then you can click on their tabs in the collections. Every collection can have a shareable link for itself. Essentially, multiple tabs can have a single link that can be shared with anyone and they'll get access to all the links on a webpage. There are several other features present in Toby such as saving all your tabs into a single collection and cloud backup as well.
