

### Yeast Superbug

A disease causing yeast is spreading across the world, resisting all efforts to kill it or treat it. <https://digit.in/Aug18-28-1>

### Heat waves make people dull

A study by Harvard shows that people cannot think straight during times of intense heat. <https://digit.in/Aug18-28-2>

# Monitoring resource usage on your Android smartphone

Worried about apps utilising too much battery or eating up all your data? We've got you covered.

**Abhijit Dey** | [abhijit@digit.in](mailto:abhijit@digit.in)

**A**

s an Android power-user, you might be utilising a long list of apps on a daily basis. It could be apps for

productivity, fitness or even games. Using a lot of applications might lead to a sense of insecurity on the kind of resources they could be eating up. Eventually, when there are multiple apps running in the background, you could face annoying lags and stuttering. Monitoring memory usage will give you a better idea on the apps that are taking up more RAM. Most of the apps you use probably require an Internet connection, but how would you know if there are certain ones that are sneakily trying to establish a connection? If you think it's time to take matters into your own hands and actually monitor everything going on in your smartphone, here are a few apps to let you track all the usage and activity.

## CPU USAGE

The first parameter you'd want to monitor would be your CPU usage. Starting from Android Oreo, third-party applications won't get access to CPU utilisation numbers of different applications due

to security reasons. This means the only data that you can now view are the clock frequencies of all the cores. Although this is a bummer, we'd prefer

better security. Hence, all you can monitor is the rise and fall of CPU frequencies but you won't be able to determine which apps are doing it. You'll also get an idea on how much time the CPU has spent at certain frequencies. You can try out an app called Simple System Monitor to view your CPU frequencies and even other usage parameters such as GPU, RAM, Disk Activity, etc.

One interesting feature is that the usage graph of certain parameters can be viewed in a floating window.

## RAM MONITORING

RAM or memory usage monitoring is something Android offers by default. And now, there's much more granular data being provided. In order to check which apps are taking up your memory, head over to Developer Options and look for Running Services. Here you will find all the applications loaded onto your RAM along with the amount of memory they are occupying. If you come across some application that you don't want to run in the background, you can simply force stop it. Do note,
