

### No Man's Sky gets multiplayer

Two years since its launch, No Man's Sky finally gets true multiplayer update codenamed 'Next'. <https://digit.in/Aug18-30-1>

### Google Maps for bikes

Google Maps with routing specific to motorbikes is about to make its way into most south-east Asian countries. <https://digit.in/Aug18-30-2>

# A versatile home for Agent001's gear

Agent001 is on a mission, he needs a new camera bag for his fancy DSLR and lenses

agent001 | [agent001@digit.in](mailto:agent001@digit.in)

O

n a recent trek to the marshes near Navi Mumbai, I had the misfortune to lose my camera bag. Well I

didn't misplace it or anything, the marshes are extremely slippery and when I did inevitably slip, the cable eyelet on the bag caught onto a nearby stump and the entire section just tore off. If it were a simple zipper coming loose, then I could have easily gotten it repaired but with the entire section coming off, even the inner waterproof layers tore. Fixing that is going to be a chore and there's no telling if the bag will indeed be waterproof after I'm done. Sure I can go to town with a lot of duct-tape but I doubt the end product will last for long. So yeah, I need a new camera bag and I need as soon as possible.

Before we get into what I finally ended up buying, I think it's best that I put down what all I wanted in my new bag. It better have adjustable compartments and the padding has to be just right. By that I mean it shouldn't be too thick wherein the dividers become too rigid and it better not be too thin that it fails to protect the cameras and the lenses. Protection is obviously the priority but being accessible while doing the same should also be a feature. I don't want a separate bag for my laptop, so there has to be a padded compartment for my laptop. For my

cameras, I have one body and a couple of additional lenses that I carry most of the time on remote trips, especially ones where I can put my photography skills to good use. A 70-200 mm, 24-70 mm and a 17-35 mm. Otherwise, it's just the additional zoom lens. You know, the usual trifecta. Then there's a flash and a couple of accessories and additional batteries. Then there's the laptop and if not a laptop, a portable wireless hard drive. Well, now that you know what's in my bag, let's get on with the actual bag-choosing, shall we?

Most of my friends were quick to drop the big names - Manfrotto, Vanguard, LowePro, etc. and one guy even went ahead and recommended that I get a Pelican case. A PELICAN

CASE! These brands certainly have offerings that offer more than my modest requirements, however, they also come with an equally high price tag. Another friend was kind enough to point me towards the surprising but often rewarding doors of Kickstarter.

We've been covering crowdfunded products for several years and we can certainly say that there are several hidden gems on the Kickstarters and Indiegogos of this world. That is where I discovered Everyday Backpack by Peakdesign and by the looks of it, I'm not the only one to have been surprised by this discovery. Generally, I'd go and check out a couple of stuff online, do my research and then check them out in person at a local store
