and maybe even purchase it from the local store if I get a good price. In case of Kickstarter projects like this one, I don't have the luxury to get a feel of the product in person, so research is all I had to fall back on.

The Everyday Backpack has a lot going for itself. Its insides are completely adjustable because the dividers are not simply hard foam with two velcro strips on either end but these have pre-made creases to fold along which allow for numerous configura-

tions. So if I want to place a smaller lens, then I can fold the divider in such a way that the small lens is held snugly while opening up the remaining space for more stuff. It's weatherproof and the straps are designed to be suited for multiple body types because they pivot at the joints. Then there are additional straps which can be accessed from the front pocket. These straps can be configured to hold vertical and horizontal loads. The sheer number of customisation and features packed

into this one product puts most market leaders to shame. While there is doubt regarding how this is going to turn out once I get my shipment, it seems that we might have a winner on our hands. If anything, it goes to show how you should always look beyond big brand names when making a purchase decision. Also, when it comes to buying something you need, friends, even those with good intentions, are not always the best people to turn to for advice. No hard feelings, guys!

## BUYING ADVICE

### LAPTOP RAM ON DESKTOP?

**Q** Hey Digit, my laptop recently got damaged in the rains and it's out of warranty so the manufacturer isn't going to repair it anymore without a hefty fee. Since I'm getting a laptop from my workplace for everything work related, I've decided to upgrade my old PC instead. I've picked the high-end configuration from the Killer Rigs section in Digit and made a few changes to some of the items. What I wanted to know is if I can use my laptop's RAM modules on my desktop? RAM seems to be ridiculously overpriced so I might as well use my laptop RAM if I can do that. So the question is, can I do that?

—Dheeraj Srinath

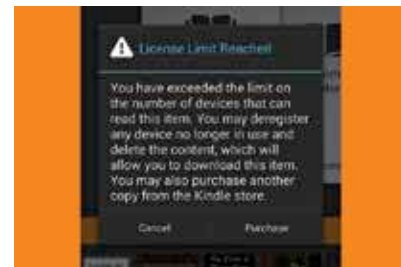

You can use your laptop RAM on your desktop configuration with the right adapters

**A** Hey Dheeraj, I hope the configuration from the Killer Rigs section lives up to your needs. As for the question about RAM, you can't use the SODIMM modules in their current form. This is because desktop RAM DIMMs are physically larger. They have 240 pins while SODIMM only have 204 pins.

However, there are adapters which allow you to use SODIMMs on desktop motherboards. They cost anywhere from \$4 to \$20 and they're kind of hard to come by in India so you will have to look them up on foreign ecommerce stores and have then shipped here. Before you do that, there are a few things that you should keep in mind. Because these are physical adapters, they do add to the overall height of the RAM module. So once installed, the height of the module might be too tall for your CPU cooler. Since there is no standard height for the adapters, you should check this and see if your cooler has the proper clearance. The second thing to note is that you might not get the same performance as your DIMM is specced for. This is applicable to extreme speeds which requires your motherboard to read from the SPI chip on the RAM modules. Some adapters may allow that, some might not. Regardless of this, you should still be able to run the modules at the standard rates for DDR4.

### KINDLE BOOKS DISAPPEARED?

**Q** Hey Agent001, I've got a new smartphone and I'm a voracious reader so I also have a Kindle. Sometimes, while I'm commuting to work, I forget to carry my Kindle and instead have to make do with my mobile phone. Recently, after changing to a new phone (thanks for the recommendation BTW), I noticed that my Kindle app doesn't show any of my books. I've tried reinstalling the Kindle

Amazon has a restriction on the number of devices that can access the same account

app and it still doesn't work. What should I do?

—Naren Rai

**A** Hey Naren, Since you mentioned that this is a new phone, I'd like for you to login to your Amazon account on your laptop or desktop and click on your Account name, then navigate to 'Digital content and devices' and then go to 'Content and Devices'. Over there you should see a Devices tab on the top. Check how many devices there are and deregister any of the devices that you aren't using. Amazon has a limitation on the number of devices that your account can be signed in at any given time. So there's a likelihood that you have crossed that limit. Also, the app should have given you an error message regarding the same. Sometimes there are limitations based on the particular book and you might have to purchase an additional copy in order to read the same on more devices. If this doesn't work, I suggest writing to Amazon with details regarding your phone and they should get that sorted out.
