

Faradeus

Funding: \$7,676 of \$7,000 goal

Link: <https://dgit.in/faradeus>

The Faradeus is a self-charging “eternal” flashlight which can charge itself, all you have to do is shake it to charge it. Hmm, it looks like long lasting is a theme for this month’s crowdfunding roundup. To know why, check out the other entries.

The Faradeus is a pocket-sized flashlight, machined from a single piece of aircraft aluminium. It’s also shock and waterproof. This is of course, in addition to it being able to self-charge. Faradeus doesn’t need to be charged or need a change of batteries. On the inside, it’s got a supercapacitor that powers the LED. It uses electromagnetic induction to function, something Michael Faraday discovered way back in 1831. He is also the inspiration for the name of the Faradeus.

Inside the Faradeus, you have a copper inductor wound on a plastic tube, diode bridge and a supercap to store energy. Then there’s the LED on the top. Inside the tube you have a magnet that travels freely across the copper inductor. Whenever this happens (when you shake the Faradeus), a significant amount of current is generated, enough to power the LED.

At full power, the Faradeus can provide you with one hour’s worth of light, and has a guaranteed 1,00,000 cycles of recharging. Pretty handy. Check Faradeus out on Kickstarter.

Comper

Funding: \$20,342 of \$9,937 goal

Link: <https://dgit.in/comper>

The Comper is a smart forehead thermometer. In addition to being able to tell your temperature, Comper can also help you track, record and analyse data.

Comper comes with its own Health App, where all the data is tracked and stored for easy analysis by you. The app can make use of different information such as your temperature, body type, weight, exercise frequency etc, to build a fitness model for an individual.

Comper is designed to make taking body temperature as easy as possible. All you need to do is take the Comper, which is always on standby, tap the button (there’s just the one, it’s really easy to use)

to wake it up, and press the button again to take a reading after placing the sensor on your (or whoever’s temperature you’re taking) forehead. Temperature is taken in a second. Definitely way faster than the thermometers we’re accustomed to which are required to be placed under our tongues for a full minute to get the temperature. Also holding that under your tongue isn’t exactly a comfortable situation. Additionally, measurements here are accurate, with a 0.2 degree Celsius margin of error. And definitely easier to read than a traditional thermometer.

LIMBO

Funding: \$505,483 of \$40,000 goal

Link: <https://dgit.in/limbo>

LIMBO is a smart top, well, a self-balancing electric gyro to be more precise. What can it do? Well, it can spin for a long time. How long? Around 4 hours. That’s quite impressive. What purpose does it serve? Well, nothing really, it’s just really cool. It would definitely make a nice showpiece. A ready-to-go magic trick up your sleeve, where you can fool people into thinking they’re in a dream, Inception style.

It actually holds a Guinness world record apparently, for being the longest spinning mechanical top. The record time is a whopping 27:09:24 hours. Well, that’s waaay longer than the advertised 4 hours.

On the surface, LIMBO looks like a regular shiny top, just asking for you to give it a spin. Once you give in and spin LIMBO, you’ll notice that it just keeps on spinning. And spinning, and spinning, and spin- you get the drift. You’ll be waiting a long time waiting for it to stop spinning if it can actually spin for as long they claim.

LIMBO comes with a long lasting rechargeable battery and additionally, it’s able to adjust its speed in relation to the surface it’s spinning on. You can check out this ever spinning top on Kickstarter, and maybe even get yourself one.
