Sony WI-SP500

Quality sports audio

The Sony WI-SP500 isn't the best sounding bluetooth headphone you can get at the ₹5000 price point, but it is definitely one of most well built. Right out of the box, the cylindrical earpieces might cause a weird first impression, but once these units go on your ears, they are fairly snug and do not fall off even after significantly active workouts. One of the problems with it is the 'open-air' design that makes it susceptible to external noise – but it is exactly this feature that makes it suitable for use during your runs. This comes at the cost of punching power - for instance, the impact of the background loop in

Uptown Funk by Bruno Mars is lacklustre. Although, listen to tracks within its comfort range like *Hotel California*, and you'll have to try a fair bit to find faults – keeping the

price point in perspective, of course

If you're a sports enthusiast and go for regular workouts or runs, the SP500 is among our new top recom-

mendations for you. It falls within budget for a wide variety of users, and while it may not be the purest audiophile-grade offering from Sony, it offers the right mix of audio performance and build quality, and comes with water resistance. On the other hand, it is ideal for an office environment as well, keeping you available to your colleagues without taking away from the audio experience save for the last 15% of the loudness scale. For bass-freaks, however, this isn't the ideal audio companion.

ASUS TUF B450M-PLUS GAMING

Type-C, overclocking and quality on a budget

The ASUS TUF B450M is what most of the folks eager to build an AMD system have been waiting for.

These B450 boards offer almost all the features of the higher-end X470 chips. What's nice of AMD is that they've retained the overclocking capabilities in the B450 chipset. The other prominent feature is AMD's StoreMI which is a software solution that ships with all 400-series boards. You can use StoreMI to combine your SSD and HDD to get a single drive which offers the best of both worlds. StoreMI intelligently moves the more frequently used files onto your SSD while the less frequently ones are shifted onto the hard drive. What's better is that

StoreMI works with practically every type of non-volatile storage medium and even volatile storage such as RAM.

Coming back to the ASUS TUF B450M-PLUS, it uses a 4+2 power phase VRM and has the bare es-

entials in terms of rear I/O. However, there's a Type-C USB port present.

There isn't much RGB happening with just one array of LEDs being present in the bottom right corner of the board.

As for the TUF branding, we did notice quite a lot of features such as the reinforced PCIe slot, surge protection on I/O slots and a heatsink on the VRM in this price range. Overall, the ASUS TUF B450M-PLUS GAMING shows promise to be a go to motherboard for the average joe.
