Smart home Devices

This list of 10 futuristic gadgets, ranging from water filters, to forks to pet feeders is sure to make your home smarter. <https://digit.in/Aug18-44-2>

AMIGO STK 7002

Just like the previous gamepad, the STK 7002 doesn't offer much. It's also priced low and you will be able to play several popular titles from the Play Store. Again, while this gamepad claims it can be used with iOS devices,

Amigo STK 7002

it isn't detected by the officially supported games despite being connected to the device. However, there's no problem with Android games. We would recommend using this gamepad for anything apart from shooter games since it suffers with the same problem as the AD2021, a stiff right analog stick. The design isn't exactly ergonomic, but there are grooves behind the controller for your fingers to be placed comfortably. Instead of the usual two trigger, two bumper layout, the gamepad has four triggers, with two of them placed underneath the gamepad. Build quality is mediocre again, even worse than the previous model. Pressing the analog sticks vibrates one half of the gamepad indicating a hollow design. It's certainly louder than the other gamepads, and sometimes it can be annoying. The STK 7002 does come with a smartphone holder but it feels flimsy when it's closed. Both the STK AD2021 and STK 7002 should only be considered if you don't want to invest a lot of money. Based on the differences that we've mentioned here, you can pick one for yourself.

GAMESIR G5

While setting up the comparison test, most of us at the lab were look-

ing forward to getting our hands on the GameSir G5. On first glance, you would think that it's the Steam controller. That's because the G5 also incorporates a touchpad on the right side instead of the action buttons. They haven't really replaced the buttons but reduced their size and moved them to the top. Additionally, they've also provided four more buttons below the touchpad. The G5 includes an overwhelming number of buttons as compared to traditional gamepads, eight to be precise. Apart from the extra four near the touchpad, there are two extra triggers on the bottom and two bumper buttons on the top. To sum it all up, the G5 has four triggers, four bumpers, eight action

buttons, a pair of analog sticks and a D-pad. The location of the triggers and bumpers are such that you will be able to reach them in a natural holding position. You don't have to strain your fingers to reach buttons placed miles away. All the gamepads in this comparison use membrane switches under every button except the analog sticks. In the G5, all the previously mentioned buttons except the D-pad use tactile switches. This indicates higher durability to constant abuse which should last you comparatively longer. Because of the choice of switches, there's no analog input in the triggers. However, it shouldn't be a deal breaker. Another interesting but hidden feature is a full USB port sitting underneath the left grip. The cover can be slid out and, on the bottom, you'll find the USB port where a wireless keyboard and mouse combo can be connected. Once connected, you can play the game with your keyboard and mouse.

The G5 comes with its own emulator app and store where all the sup-

ported games are listed. Although you can easily connect the gamepad and play a few games, you won't get the ability to remap the buttons. You heard that right. You can remap the buttons using the emulator in any game and save the profile. This is one feature that makes the GameSir G5 stand out from the competition. The GameSir World app needs to be running in the background while you're playing the game. It also requires you to run the game from the app so that the overlay is present in the game. If the game is officially supported, you can import publicly available profiles. Otherwise, you can take your sweet time to remap all the control individually and create your own custom profile.

There are just too many features on the GameSir G5. Connecting it to Android devices wasn't much of a problem. After downloading the app, we opened the games from the menu. Although, it didn't require much of a

GameSir G5

setup in the games from our list, we tried out more complex games. PUBG Mobile for example, which has too many buttons. However, all the buttons could be assigned to the gamepad using the overlay and we still had unassigned buttons left over. We noticed a significant advantage over playing the game without the gamepad. The same was the case with Arena of Valor, where several buy items could be directly assigned to all the extra action
