

THIS IS TECHNOLOGY, CULTURE AND SCIENCE WITH A DIFFERENCE, AND THAT DIFFERENCE IS USUALLY ENOUGH TO MAKE MOST NORMAL PEOPLE GO "WTF?"

ALT this month:

We bring you several melee weapons that originated in ancient and medieval India. Then we look at a fictional future scenario of water scarcity in India and how we could solve it. In DGT, as usual, we cover products that induces desire and greed in us. Some movie and TV show reviews under Temptation and finally a chat with HP India's MD, Sumeer Chandra.

Milky Way space grease

Scientists have found that there's a whole lot of toxic space grease in the Milky Way, a whole lot more than they thought, between the stars in the galaxy. The grease is an oily form of hydrogen-bound carbon called aliphatic carbon and is leaked into space by blazing stars.

WHAT'S NEW

Chernobyl wolves

Grey wolves from the radioactive forbidden zone of Chernobyl are now roaming out into the rest of the world.

A new study suggests that they may now carry their radioactive genes far and wide. However, there doesn't seem to be any problem with them. They aren't mutant in any way or don't have any superpowers, they're radioactive, but they're normal grey wolves. Researchers add that their prosperity and their spread to regions outside of Chernobyl is thanks to the fact that the radiative zone now acts like a wildlife reserve.

Ever since the explosion of the Chernobyl nuclear power plant in Ukraine in 1986, a 30 kilometer diameter around the reactor was

deemed off-limits for all. While some of the zone is now open to tourism, nobody is still allowed to live inside that zone. The lack of human life has caused wildlife in the region to prosper.

Investigations have revealed mixed results, with some saying the wildlife suffered from the fallout, and other saying wildlife prospered.

Otzi the Iceman's last meal

Otzi the Iceman, who died about 5,300 years ago was first discovered by a pair of hikers in the Otzal Alps, all the way back in 1991.

After being discovered, researchers studied just about everything they could about him, the material of his coat, the clothes he was wearing, his tooth decay. Unfortunately, they simply couldn't find his stomach, because that could give an important insight

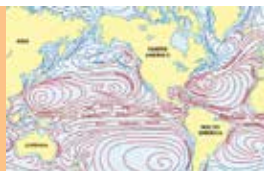

into the kind of diet people might have had 5,300 years ago. However, almost twenty years after being discovered, researchers finally found the

stomach, which had gotten pushed up under his ribs, which is normally where the lungs sit. Oh, and also, the stomach was still full with what was Otzi's last meal!

After running the contents of Otzi's stomach through several tests, researchers have discovered that Otzi's final meal was some dried ibex meat and fat, red deer, einkorn wheat, and traces of toxic fern.

Oceans are slowing down

While it was previously indicated that ocean current circulation would slow down due to climate change, a study suggests that circulation has slowed down dramatically, and climate change doesn't explain why it's happening 10 times faster.

Mayans used chocolate as money

A new study reveals that the Mayans used chocolate as a form of currency at the height of their civilisation, it also suggests that the loss of chocolate could have played a role in the civilization's downfall.

Sony accidentally uploads movie

Sony Pictures Entertainment accidentally uploaded the entirety of the movie Khali the Killer on YouTube instead of a trailer, which is what they were initially planning to upload. At around 1 hour and 30 minutes in length, the movie was up on YouTube for several hours.
