

SECURITY WATCH

New fast-acting vulnerability on phones

With a newly discovered vulnerability, in a single transaction, a side channel attack can obtain the encryption key for a mobile device's RSA implementation without touching the device physically.

The method involves listening to electromagnetic signals generated by a processor when it is working which allows the conversion of the signals back to the original bits to get any data desired, including the encryption keys. The demonstration has been performed on "two Android-based mobile phones and an embedded system board, all with ARM processors operating at high (800 MHz to 1.1 GHz) frequencies". A small antenna placed close to the device is capable enough for the capture. The good news? Reading bits in parallel makes decryption a far more difficult job. Or you could just not put your phone down on the table when someone has a briefcase or something similar close by.

MOBILE WATCH

Doogee S70

Gaming phones are the smartphone industry's new trend, and Doogee doesn't want to stay far behind. However, on the Doogee S70, the first problem shows up with the one generation old Helio P23 Octa-core 2.5GHz chipset, which, compared to counterparts from ROG and Razer, is significantly weaker. However, the phone sports a massive 5500mAh battery along with IP68 certification, standing true to the rugged tag.

Other noteworthy features include a 6-inch full HD+ screen, 12MP+5MP rear camera setup, 16MP selfie camera, Android 8.1, USB Type-C, NFC, and a rear fingerprint scanner. There's also a gaming mode on the phone that can be activated by a single button, as well as support for gamepads as well as a custom gamepad that isn't bundled.

APP WATCH

Anchor

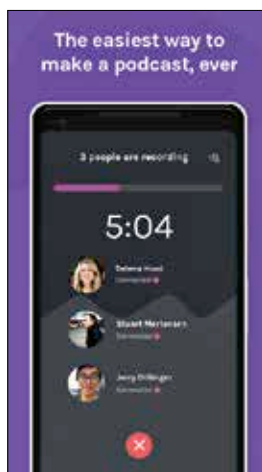

Ever wanted to start your own podcast but never really figured out how to do so? Anchor one app is perhaps the easiest way to have your own podcast in as few steps as possible.

Once you've installed Anchor, you need to log into the app with your Google Account or your email. Once you've done that, you can choose your objective out of creating podcasts, importing podcasts or even just listening to them. We are interested in the first

one. There are essentially four steps to the process - you record or import pre-recorded audio. You can also get your friends to join into a particular recording session. To do that, you have to share a link which will prompt them to join your session and then audio from both sources will be combined into your recording.

Either ways, once you've recorded a segment, you can preview it to check how it sounds. You can even add background tracks from a list of available tracks, and then hit save.

Unless you hit the close button on the top left, you won't be able to see the episode layout. You can also add transitions, voice messages from your Anchor listeners, and even music from Spotify or Apple Music (on iOS). Once you're ready, just hit Publish->Publish everywhere and fill in details like the name of your podcast, the URL you want etc and then Anchor will take care of the app-

als required from individual platforms. Only drawback? You can't select which platforms to publish to.

Daywise

Daywise lets you group your notifications app-wise and contact wise so that you only receive them at certain times of the day. You can also set exceptions for particular apps and contacts that you do not want to miss.

Ava Lockscreen

This one's a new lockscreen app that lets you get your favourite widgets one swipe away. You can also check and interact with your notifications in greater detail, set custom shortcuts, without losing the standard Android security.

Shorty

While Android lets you add apps to your homescreen, this app adds the ability to add shortcuts to particular files, URLs, text to your homescreen. You can even customise the icon as well as the shortcut text.
