

No more getting stuck in traffic in the eventual scramble to safety! Beat the crowd, plan ahead!

ABACUS APP

In case you're a time-travelling mathematician from 3000 years ago and calculators (or maybe, the decimal number system) just aren't your thing - here's all you need. The Abacus App raises the app version of "Wait, when will I ever use this in the real world?" While there is some evidence that abacus use develops mathematical abilities in young children, it isn't clear if the replacement of the tactile interface with a touchscreen will preserve that effect on them.

MOSQUITO REPELLENT APP

Don't let the tabloids distract you, there's controversy even on the Play Store. Anti Mosquito and similar apps claim to generate a high frequency sound inaudible to humans that repels mosquitoes. This claim has proven extremely contentious - there are warring factions who believe that the sound is and isn't audible to them, as well as other clans who support and reject its efficacy as a repellent. Try it for yourself, and pick your team.

RADIATION DETECTOR

It's time to brush up on your conspiracy theories. Is the government controlling us all with mind-control rays? Are nuclear power plants actually secret prisons? GammaPix is a legitimate radiation detector. While it's nowhere close to as accurate or sensitive as a Geiger counter, it can actually detect radiation from mobile phones, microwaves and similar devices. Give it a try, but make sure to wear your tinfoil hat while you're at it.

METAL DETECTOR

In a career slump? You can resort to hunting for scrap metal with the Metal Detector app. Before you scoff, it actually works - your phone can detect variations in electromagnetic fields to beep whenever there's a magnetic metal in the vicinity. Unfortunately, this will only work with copper, iron and nickel - not steel, brass, and many others that you might want to check.

DRAWING THE SHORTEST STRAW

Chwazi Finger Chooser is an interesting solution for times when you and your friends need to draw lots. Who's going to answer the doorbell? Or get up from the super-comfy couch during a movie? Or order pizza? Which timeline is it going to be? The app is simple - one finger per person on the phone screen. It picks one of you randomly with a neat glowy interface. Sucks to be you, bud. Now go get the door.

BABY TRANSLATOR

Disclaimer: it is completely unclear if this app has any scientific basis or if it's a joke. But hey, it exists. From the mouths of babes... come meaningful, interpretable demands, according to Baby Language. It supposedly used the pitch, consonant sounds, and other parts of the crying sound to identify why your baby is crying. Try it, your mileage may vary.

"I don't know what's bothering me but you have to fix it!"

BREATHALYZER

Alcohol Breathalyzer is the perfect app for times when you're sober enough to enter your body weight, amount of alcohol consumed, time to start drinking and duration of drinking. Based on these stats, it gives you your approximate level of intoxication. This is a good app to have, because if you can use it, you're probably in a decent condition. Take this with a gigantic pinch of salt, and please never drink and drive.

Now that your Android device has had a complete personality makeover, go ahead and give it a case that fits its vibe - because at the end of the day, we're all consumer sheep and happy about it. So this is your chance to stand out of the crowd and make yourself and your device the wackiest of the lot. Send us pictures! 

DATA STORAGE INSIGHTS

As per an IDC report, data volume will grow to an astounding **163 zetabytes (ZB) by 2025**, a ten-fold increase over what was created in 2016. Conventional storage technology will not be able to match such a rate of growth. However, Seagate is ready with advanced technology to meet the exponential demands of the future.

Heat Assisted Magnetic Recording (HAMR)

The key to enhanced storage capacity is greater areal density, that is, to maximise the amount of data that can be stored on a hard drive without significantly increasing its form factor. HAMR technology uses a new kind of media coating on each disk that allows data bits, or grains, to become smaller and more densely packed than ever, while remaining magnetically stable. A small laser diode attached to each recording head heats a tiny spot on the disk, which enables the recording head to flip the magnetic polarity of each very stable bit, enabling data to be written. Seagate's HAMR enabled drives have sailed through performance tests and we have already commenced shipping for customer integration tests. We are on track to deliver 20TB+ drive capacity by 2019.

Multi Actuator Technology (MACH.2)

Increasing storage capacity, though, is winning just half the game. Without boosting access speeds, we cannot make full use of data potential. Seagate's latest Multi Actuator Technology (MACH.2) is designed to potentially double the performance of future-generation hard drives. Actuators move a hard drive's heads over the media surface, to read and write data. Hard drives today are equipped with a single actuator, which moves all the read-write heads together in synchronous motion. Initially, MACH.2 enabled drives will have two actuators, each moving half the total number of recording heads. Functionally, this means a Dual Actuator drive can operate as two separate drives, enabling execution of two data requests simultaneously, thus potentially doubling access speeds.

Together, Seagate's HAMR and Multi Actuator technologies provide the future of capacity and performance.
