

Big Clapper

Funding: \$13,084 pledged of \$101,471 goal

Link: <https://dgit.in/BigClapper>

There's been a lot of hue and cry over robots taking over our jobs in the near future. We've been designing cutting edge AI enabled robots that have started to match and exceed our capabilities in day to day life. However, nobody really talks about what AI is going to do to the jobless. There's a number of useless things that the jobless, or ones with too much free time on their hands, who use those very hands in numerous pointless ways like fighting, surfing Facebook, or even clapping. Joining that particular line of robots is the Big Clapper from Japan. What is it all about? It is big, and it claps.

Well, it is not exactly big, it just has big hands, and it can almost only clap in one particular way. However, that doesn't detract from the sheer genius that this crowd-funded robot is going to be. Where else will you get a robot that has a motion sensor on it and can sense you in its vicinity and... clap! It can speak a number of phrases that can be configured by you, or even record your own phrase if you please! However, this recorded piece will be recited back to you in the voice of the big clapper. I mean, we don't know why we are still holding on to our ₹2,50,000, do you? You can even pay double that to get a perfectly synchronized pair of these and clap your way to salvation!

Light House Suspenders

Funding: \$2,611 of \$10,000 fixed goal

Link: <https://dgit.in/LightHouseSuspender>

Do you have problems starting conversations at parties? Or problems coming back home in the dark? Do you wear pants that need suspenders to be held up? The answer to all of these questions are the Light House Suspenders that you can fund right now on Indiegogo. Basically, they are a pair of detachable Y-shaped suspenders, roughly 2-2.5cm with 120 LEDs laid out on them at intervals of 5 cm. The final product will come in three sizes and will come with button clasps.

Regardless of what it turns out to be - can you even fathom the awesomeness of this idea? This gadget essentially lets you stick lights onto yourself as an excuse for not having the ability to hold a basic conversation in a social situation! That must be helpful, isn't it?

Be ready to pay about \$25 to \$35 depending on which tier you go for. And once you have these suspenders, thank the inventors for focussing their entire energy into creating something to undeniably useful.

Stool N°1

Funding: \$5,119 pledged of \$14,000 goal

Link: <https://dgit.in/StoolNo1>

Manual, as a company, is not new to the world of crowd-funding. They've made a name for themselves by designing and running campaigns for simplistic household items, and some of their designs have found quite a strong following on Kickstarter. Perhaps the most effective way of understanding what they offer is their mission statement: Manual designs objects that celebrate slowness. These objects include groundbreaking innova-

tions such as a drip coffee maker, a set of decanters and glasses, a beer opener and now, a \$200 stool.

If you're thinking that the Stool is just another piece of furniture and people are trying to be funny here, think again. A design that brings 'visual lightness' to your home, the body is made up of 'hand welded steel wire frame' and has a 'durable powder coat finish'. The seat is 'hardwood' and made of 'ash'.

For other materials and things like metal discs for furniture pads, Manual has graciously given you the opportunity to spend an additional \$10-\$15 per stool. How can someone even resist throwing almost ₹14000 at this masterpiece, eh?
