

Magic Leap Dev Con

Magic Leap's first developer conference is coming to Los Angeles this October on the 9th and the 10th. <https://digit.in/sep18-44-1>

Power saving Apple tech

Apple may adopt a new power-saving backplane technology for iPhone and Apple Watch displays in the long term. <https://digit.in/sep18-44-2>

T

his month's, we had the perfect opportunity to skip those boring comparisons. Bikes (the ones that run on fat) are something we've hardly covered in the last few years. "Cycle vs Cycle" was something that instantly appealed to us. So, we called in for a road bike and an electric bike. Our benchmarking and testing are usually conducted in a single room, but this time, we had to move out of our comfort zone for this one. We went through grunts and pants. We present this comparison that comes out of our blood and sweat, literally.

Before we begin, let us tell you about the two bikes shall we? The Hero Lectro EZephyr brags about being India's first Electric Pedal Assisted

Cycle. This means when you push down the pedals, the cycle will give you a boost using a motor sitting in the rear axle. All the juice is provided by the Panasonic Lithium-ion battery hidden in the frame inside the lower beam. A module sitting on the left handle allows you to control the hub motor across four power modes. These modes determine for how long the assistance should run while you're pedaling including one mode that pushes the bike at a constant 6 km/hr. It also comes with an accelerator on the right handle using which you can go vroom vroom just like a regular motorcycle. The vroom tops out at 25 km/hr. We really don't know whether it wants to be a mountain bike or a road bike. The Hero Lectro EZephyr is priced at ₹26,999.

The Trek Émonda ALR 5 is a pure road biking machine. The moment we touched it, we realised that any damage will result in surrendering all our salaries for the next month. Not happening, so we were extra careful. This beast is intended for all sorts of bikers, whether beginner or advanced. Its lightweight structure got our heads spinning after discovering how it can be picked up even with just one hand - actually a couple of fingers. This is because of the different materials used in the frame and the fork. Every single part of the bike is made of high-end materials, and everything transparently listed down on the web site. This bike is directed towards riders who like going long distances faster. The Trek Émonda ALR 5 is priced at ₹1,09,250.

MATERIAL

HERO LECTRO EZEPHYR

A bike's frame determines a lot of things such as the durability, resistance to corrosion and weight. The Lectro EZephyr we got had what they call an "alloy" frame, and we assume this means an aluminium alloy. There are variants available that have a steel frame. Choosing the options can make you go wtf as you can add a steel and alloy frame simultaneously on their website.

TREK ÉMONDA ALR 5

Things are more clearer on the Émonda side. The frame is built of aluminium that has been given one of those overly enthusiastic names, so it's called Ultralight 300 Series Alpha Aluminum. Carbon is known to absorb bumps giving a better riding experience. The fork and steerer on this bike are made of carbon.

Cycle vs Cycle

The Hero Lectro EZephyr vs Trek Émonda ALR 5
